III. What would the solutions be through acceleration?

When r is constant

$$v = \lambda\nu = r\,(1/(1080/\pi)\,\theta) = (1/(1080/\pi))\,D\!\left[\frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}, \theta\right]$$

$(1/(1080/\pi))\,D[r\,(1/(1080/\pi)\,\theta), \theta]$ = acceleration of a wavelength, r, and frequency, $(1/(1080/\pi)\,\theta)$. (92)

```
(1 / (1080 / π)) D[r (1 / (1080 / π) θ), θ]
```

$$\frac{\pi^2 r}{1166400}$$

$$(1 / (1080 / \pi))\, D\left[(1 / (1080 / \pi))\, D\left[\frac{\sqrt{4 \pi r^2 \theta - r^2 \theta^2}}{2 \pi}, \theta\right], \theta\right]$$

$$(1 / (1080 / \pi))\, D\left[(1 / (1080 / \pi))\, D\left[\frac{\sqrt{4 \pi r^2 \theta - r^2 \theta^2}}{2 \pi}, \theta\right], \theta\right] = \tag{93}$$

acceleration through the height of the cone

$$\text{Solve}\left[\frac{\pi^2 r}{1166400} == (1 / (1080 / \pi))\, D\left[(1 / (1080 / \pi))\, D\left[\frac{\sqrt{4 \pi r^2 \theta - r^2 \theta^2}}{2 \pi}, \theta\right], \theta\right], \theta\right]$$

$$\left\{\left\{\theta \to 2\pi - \sqrt{-(-2\pi)^{2/3} + 4\pi^2}\right\}, \left\{\theta \to 2\pi + \sqrt{-(-2\pi)^{2/3} + 4\pi^2}\right\},\right.$$
$$\left\{\theta \to 2\pi - \sqrt{4\pi^2 - (2\pi)^{2/3}}\right\}, \left\{\theta \to 2\pi + \sqrt{4\pi^2 - (2\pi)^{2/3}}\right\},$$
$$\left.\left\{\theta \to 2\pi - \sqrt{4\pi^2 + (-1)^{1/3}(2\pi)^{2/3}}\right\}, \left\{\theta \to 2\pi + \sqrt{4\pi^2 + (-1)^{1/3}(2\pi)^{2/3}}\right\}\right\}$$

IV. Defining the Initial Distance through its Geometric Correlates

When r is constant

$$r = \frac{2 * \text{velocity} * 6\, ((180 / \pi)\, \theta) * \pi}{\sqrt{4 \pi \theta - (\theta)^2}} = \frac{2 * \left(\frac{4 \pi r^2 - 2 r^2 \theta}{4320 \sqrt{4 \pi r^2 \theta - r^2 \theta^2}}\right) * 6\, ((180 / \pi)\, \theta) * \pi}{\sqrt{4 \pi \theta - (\theta)^2}}$$

$$\frac{4 \pi r^2 - 2 r^2 \theta}{4320 \sqrt{4 \pi r^2 \theta - r^2 \theta^2}} = \tag{94}$$

velocity through the height of the cone when r is constant
(stays always the initial radius of the circle equal to the hypoteneuse
of the triangle formed by the height meeting the base of the cone).

$$\text{Solve}\left[\frac{2 * \left(\frac{4 \pi r^2 - 2 r^2 \theta}{4320 \sqrt{4 \pi r^2 \theta - r^2 \theta^2}}\right) * 6\, ((180 / \pi)\, \theta) * \pi}{\sqrt{4 \pi \theta - (\theta)^2}} == r, \theta\right]$$

$$\{\{\theta \to 3\pi\}\}$$

When r is changing

$$r = \frac{2 * \text{velocity} * 6\ ((180/\pi)\ \theta) * \pi}{\sqrt{4\pi\theta - (\theta)^2}} = \frac{\pi\left(-\frac{(4\pi r^2 - 2r^2\theta)(8\pi r\theta - 2r\theta^2)}{8\pi(4\pi r^2\theta - r^2\theta^2)^{3/2}} + \frac{8\pi r - 4r\theta}{4\pi\sqrt{4\pi r^2\theta - r^2\theta^2}}\right)}{1080} \tag{94}$$

$$\text{velocity} = \lambda\nu = r\ (1/(1080/\pi)\ \theta)$$

$$\text{Solve}\left[\frac{\pi\left(-\frac{(4\pi r^2 - 2r^2\theta)(8\pi r\theta - 2r\theta^2)}{8\pi(4\pi r^2\theta - r^2\theta^2)^{3/2}} + \frac{8\pi r - 4r\theta}{4\pi\sqrt{4\pi r^2\theta - r^2\theta^2}}\right)}{1080} == r\ (1/(1080/\pi)\ \theta),\ r\right]$$

$$\left\{\left\{r \to -\frac{\sqrt{\frac{1}{4\pi-\theta} + \frac{4\pi}{\theta^2} - \frac{3}{\theta}}}{4\pi\sqrt{\theta}}\right\}, \left\{r \to \frac{\sqrt{\frac{1}{4\pi-\theta} + \frac{4\pi}{\theta^2} - \frac{3}{\theta}}}{4\pi\sqrt{\theta}}\right\}\right\} \tag{95}$$

$$r = \frac{2 * \text{velocity} * 6\ ((180/\pi)\ \theta) * \pi}{\sqrt{4\pi\theta - (\theta)^2}} = \frac{2 * \left(\frac{\pi\left(-\frac{(4\pi r^2 - 2r^2\theta)(8\pi r\theta - 2r\theta^2)}{8\pi(4\pi r^2\theta - r^2\theta^2)^{3/2}} + \frac{8\pi r - 4r\theta}{4\pi\sqrt{4\pi r^2\theta - r^2\theta^2}}\right)}{1080}\right) * 6\ ((180/\pi)\ \theta) * \pi}{\sqrt{4\pi\theta - (\theta)^2}}$$

A Notational Language for Describing the Geometry of Space-Time

by Parker Emmerson

© October 14, 2009

I. Postulates, Structure

$C = 2\pi r$

This is the circumference of our initial circle of radius r

$C_2 = 2\pi r_1$

This is the circumference of our second circle,

the base of the cone, of radius r_1

$r^2 = r_1^2 + \eta^2$

This is the initial radius squared expressed as the slant of the cone in terms of the height of the cone, η, and the radius of the base of the cone, r_1

$r = \sqrt{(r_1^2 + \eta^2)}$ (96)

$s = \theta r$

$s / \theta = r$

The arc length taken out of a circle at a given time is =

$t = C - C_2 = 2\pi r - 2\pi r_1 = \theta r$ → Equation 7

$r_1^2 == r^2 - \eta^2$

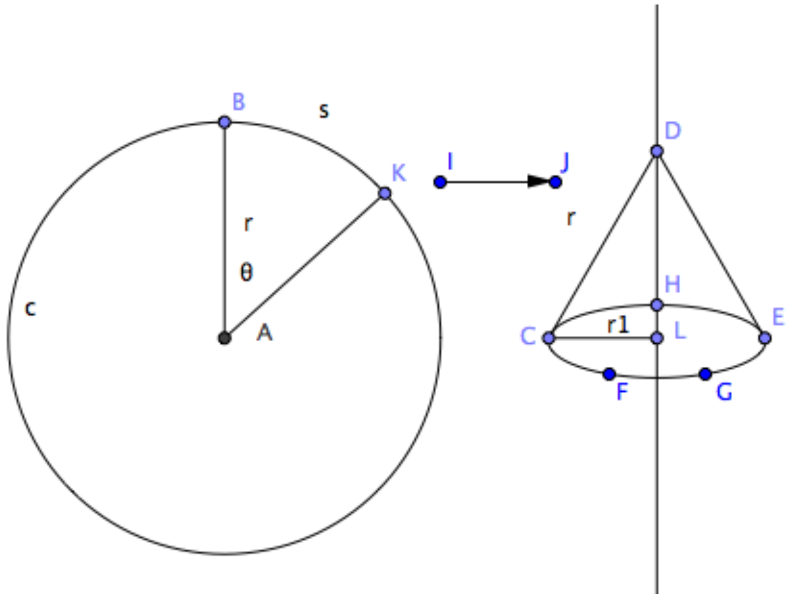
$r_1 = \sqrt{(r^2 - \eta^2)}$

$\eta \leq r$

τ = time

1 second = 6 degrees

$\tau = 6\,\theta$



I will now do some algebra to conclude what the height of the cone is in terms of the initial parameters. It can eventually be reduced to a single variable.

```
Solve[r1^2 + η^2 == r^2, η]
```

$$\left\{\left\{\eta \to -\sqrt{r^2 - r_1^2}\right\}, \left\{\eta \to \sqrt{r^2 - r_1^2}\right\}\right\} \quad (97)$$

We say that the amount of $\theta r =$ s, taken out of the circle is the change in the circle's circumference that is the base of the cone. The change is equal to $s = 2\pi r - 2\pi r_1$.

Notice that θ = ((2 π r) / r) – ((2 π r 1) / r), because we divide by r on both sides.

We will focus on the positive solutions for the height of the cone.

```
Solve[η == Sqrt[r^2 - r1^2], r1]
```

$$\left\{\left\{r_1 \to -\sqrt{r^2 - \eta^2}\right\}, \left\{r_1 \to \sqrt{r^2 - \eta^2}\right\}\right\} \quad (98)$$

This is the change in circumference with the substituted expression for r_1 in terms of h and r.

$$r\,\theta == s == 2\,\pi\,(r) - 2\,\pi\,\sqrt{((r)\,\verb|^|2 - \eta\,\verb|^|2)} = 2\,\pi\,(r) - 2\,\pi\,r_1 \quad (99)$$

$$\theta == (2\,\pi\,r)\,/\,r - (2\,\pi\,r\ _1)\,/\,r) = ((2\,\pi\,r)\,/\,r) - \left(\left(2\,\pi\,\sqrt{-\eta^2 + r^2}\right)\Big/\,r\right)\right)$$

```
Solve[θ * r == 2 π (r) - 2 π Sqrt[((r)^2 - η^2)], η]
```

$$\left\{\left\{\eta \to -\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}\right\}, \left\{\eta \to \frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}\right\}\right\} \qquad (100)$$

$$\text{Solve}\left[\eta == \frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}, r\right]$$

$$\left\{\left\{r \to -\frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta - \theta^2}}\right\}, \left\{r \to \frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta - \theta^2}}\right\}\right\} \qquad (101)$$

II. Motion through the Space - Time

If there is something traveling over the distance, η, then its velocity is said to be the first derivative with respect to time. What if r is constant, which it is when it' s the hypoteneuse of the triangle made by the cone.

ν = frequency = 1 / τ = (1 / (1080 / π) θ),
because each second is in terms of degrees of a clock, and in terms of theta,
which is in radians, we must make the following conversion : (102)

$$\text{Time} = 6\left(\theta_{\text{degrees}}\right) = 6\,(180/\pi)\,\theta = (1080/\pi)\,\theta$$

$$\eta \to \frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}$$

$$v = \lambda\,\nu = r\,(1/(1080/\pi)\,\theta) = ((1/(1080/\pi))\,D[\eta, \theta]) = 1/(1080/\pi))$$
$$D\left[\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}, \theta\right] \qquad (103)$$

The velocity of η is equal to the first derivative of η with respect to time. The constant (1/(1080/π)) is taken out of the equation in order to perform the derivative.

$$(1/(1080/\pi))\,D\left[\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}, \theta\right]$$

$$\frac{4\,\pi\,r^2 - 2\,r^2\,\theta}{4320\,\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}$$

$$(1/(1080/\pi))\,D\left[\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}\left(\sqrt{1 - ((v)\text{^}2/c\text{^}2)}\right), \theta\right]$$

$$\frac{\sqrt{1 - \frac{v^2}{c^2}}\,\left(4\,\pi\,r^2 - 2\,r^2\,\theta\right)}{4320\,\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}} = c$$

```
c := (2.99792458 * 10^8)
```

$$\text{Solve}\left[\frac{\sqrt{1-\frac{v^2}{c^2}}\,\left(4\,\pi\,r^2-2\,r^2\,\theta\right)}{4320\,\sqrt{4\,\pi\,r^2\,\theta-r^2\,\theta^2}}==c,\ v\right]$$

$$\left\{\left\{v\to-\frac{c\,\sqrt{4\,\pi^2-4\,\pi\,\theta-\frac{18\,662\,400\,c^2\,\pi\,\theta}{r^2}+\theta^2+\frac{4\,665\,600\,c^2\,\theta^2}{r^2}}}{\sqrt{4\,\pi^2-4\,\pi\,\theta+\theta^2}}\right\},\right.$$
$$\left.\left\{v\to\frac{c\,\sqrt{4\,\pi^2-4\,\pi\,\theta-\frac{18\,662\,400\,c^2\,\pi\,\theta}{r^2}+\theta^2+\frac{4\,665\,600\,c^2\,\theta^2}{r^2}}}{\sqrt{4\,\pi^2-4\,\pi\,\theta+\theta^2}}\right\}\right\}$$

V. Dealing with n

$$\eta \to \frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}$$

$$v = \lambda\,\nu = r\,(1/(1080/\pi)\,\theta) = ((1/(1080/\pi))\,D[\eta,\,\theta]) = 1/(1080/\pi))\;D\left[\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi},\,\theta\right] \quad (112)$$

The velocity of η is equal to the first derivative of η with respect to time. The constant (1/(1080/π)) is taken out of the equation in order to perform the derivative.

Solve$\left[\theta\, r == 2\,\pi\,(r) - 2\,\pi\,\sqrt{((r)^{\wedge}2 - \eta^{\wedge}2)}\,,\,\eta\right]$

$$\left\{\left\{\eta \to -\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}\right\},\left\{\eta \to \frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}\right\}\right\}$$

go from the philosophy to the axioms / geometric description,
backed up with psych and philosophy

take the geometric situation described and working out what follows.

$$\eta == \frac{\sqrt{4\,\pi\left(\frac{2\,\pi\,r\,\mathrm{Sin}[\beta]}{\sqrt{4\,\pi\,\theta-\theta^2}}\right)^2\theta - \left(\frac{2\,\pi\,r\,\mathrm{Sin}[\beta]}{\sqrt{4\,\pi\,\theta-\theta^2}}\right)^2\theta^2}}{2\,\pi} = \mathrm{rate} * \mathrm{time} = \mathrm{rate} * 6\,((180/\pi)\,\theta) \tag{117}$$

$$\left\{\left\{r \to -\frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta - \theta^2}}\right\},\left\{r \to \frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta - \theta^2}}\right\}\right\} \tag{118}$$

$$\left\{\left\{r_1 \to -\sqrt{r^2 - \eta^2}\right\},\left\{r_1 \to \sqrt{r^2 - \eta^2}\right\}\right\} \tag{119}$$

$$r_1 = \sqrt{r^2 - \eta^2} = r\,\mathrm{Cos}[\beta] \tag{120}$$

There are special cases of the system when $h = r$, when $\beta = \theta$,
when $r_1 = r$ (the initial condition), and when $r_1 = h$.

Usually, we would think that $\beta \le \pi/2$, whereas $\theta \le 4\,\pi$. (121)

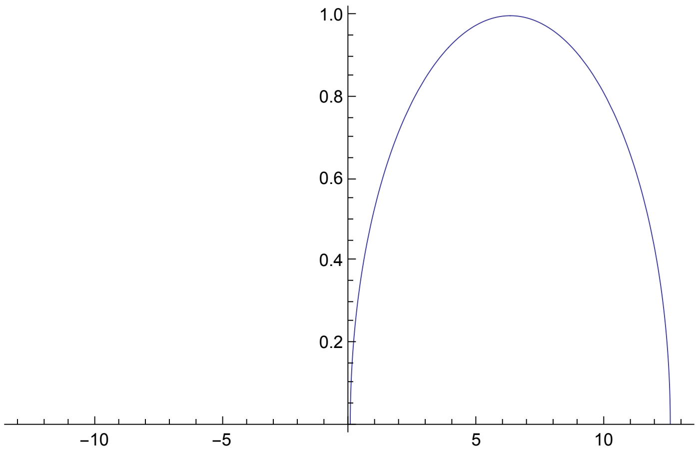
We can show that $\theta \le 4\,\pi$ by setting r equal to one in the equation $r = \dfrac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta - \theta^2}}$

$\beta \le \pi/2$ comes from the fact that when the cone folds all the way up,
it makes a right angle with the x axis.

Solve$\left[1 == \dfrac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta - \theta^2}},\,\eta\right]$

$$\left\{\left\{\eta \to \frac{\sqrt{(4\,\pi - \theta)\,\theta}}{2\,\pi}\right\}\right\}$$

$$\text{Plot}\left[\frac{\sqrt{(4\pi-\theta)\,\theta}}{2\pi}, \{\theta, -13, 13\}\right]$$



There is a particularly interesting special case of the system, however, when the square of the height of the cone is equal to the area of the base of the cone.

So What's the Point? How to Find the Four Noble θ Solutions, or Truths of θ.

$$r_1 = \sqrt{r^2 - \eta^2}$$

$$\eta = r\,\text{Sin}[\beta]$$

$$\left\{\left\{\eta \to -\frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}\right\}, \left\{\eta \to \frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}\right\}\right\}$$

$$\left(\frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}\right)\text{^}2 = \eta\text{^}2$$

$$\left(\frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}\right)\text{^}2$$

$$\frac{4\pi r^2\theta - r^2\theta^2}{4\pi^2}$$

$$\frac{4\pi r^2\theta - r^2\theta^2}{4\pi^2} = \pi\,(r_1\text{^}2) = \pi\left(r^2 - \eta^2\right) = \pi\left(r^2 - \frac{4\pi r^2\theta - r^2\theta^2}{4\pi^2}\right)$$

$$\text{Solve}\left[\pi\left(r^2-\frac{4\pi r^2\theta-r^2\theta^2}{4\pi^2}\right)==\frac{4\pi r^2\theta-r^2\theta^2}{4\pi^2},\ \theta\right]$$

$$\left\{\left\{\theta\to\frac{4\pi+4\pi^2-\sqrt{16\pi^2+16\pi^3}}{2+2\pi}\right\},\ \left\{\theta\to\frac{4\pi+4\pi^2+\sqrt{16\pi^2+16\pi^3}}{2(1+\pi)}\right\}\right\}$$

$$N\left[\frac{4\pi+4\pi^2-\sqrt{16\pi^2+16\pi^3}}{2+2\pi}\right]$$

3.19576

$$N\left[\frac{4\pi+4\pi^2+\sqrt{16\pi^2+16\pi^3}}{2(1+\pi)}\right]$$

9.37061

$$\text{Solve}\left[\pi\left(r^2-\frac{4\pi r^2\theta-r^2\theta^2}{4\pi^2}\right)==\frac{4\pi r^2\theta-r^2\theta^2}{4\pi^2},\ r\right]$$

$$\{\{r\to 0\},\ \{r\to 0\}\}$$

Thus, we have shown that a point, by definition, is the place at which the square of the height of a cone is equal to the area of the base of the cone when talking about a transition or even a translation of points along an axis. We have also shown that the point has an inherent angle of $\frac{4\pi+4\pi^2+\sqrt{16\pi^2+16\pi^3}}{2(1+\pi)}$ and $\frac{4\pi+4\pi^2-\sqrt{16\pi^2+16\pi^3}}{2+2\pi}$radians.

So, what does θ r look like now?

$$\theta\, r = r\,\frac{4\pi+4\pi^2+\sqrt{16\pi^2+16\pi^3}}{2(1+\pi)},\ r\,\frac{4\pi+4\pi^2-\sqrt{16\pi^2+16\pi^3}}{2+2\pi}$$

$$v=\lambda\nu=r\,(1/(1080/\pi)\,\theta)=D\left[\frac{\sqrt{4\pi r^2\theta-r^2\theta^2}}{2\pi},\ \theta\right]$$

The velocity of η is equal to the first derivative of η with respect to time.

$$D\left[\frac{\sqrt{4\pi r^2\theta-r^2\theta^2}}{2\pi},\ \theta\right]$$

$$\frac{4\pi r^2-2r^2\theta}{4\pi\sqrt{4\pi r^2\theta-r^2\theta^2}}$$

Contour is said to be the experience of this kind of polar equation from information available in light. Light is interpreted in the polar coordinate system by a human being when perception occurs. How it is

interpreted depends partially on how you see something. For instance, I can see this graphed contour like a cylinder or two spheres. We call this a conisphilinder. It's holographic characteristic is the first special case.

```
c := (2.99792458 * 10 ^ 8)
```

Depending on the conversion I will decide to use for exchanging angle involved in folding up the circle into a cone and the time that has passed, I will find different solutions and options regarding the system.

First, we will use the following conversion

$$\eta := \text{rate} * \text{time} = c * \tau = \text{height of cone} \tag{122}$$

$\tau := 6\left(\Theta_{\text{degrees}}\right) = 6\,((180/\pi)\,\Theta)$, because if theta were in radians to begin with,
we would have to convert that number of radians to degrees. This way,
both our thetas are in radians,
but our result accounts for the constant of the degrees involved in measuring time.

```
(180 / π)
```

$$r = \frac{2 * c * \tau * \pi}{\sqrt{4\,\pi\,\Theta - \Theta)^2}} = \frac{2 * c * 6\,((180/\pi)\,\Theta) * \pi}{\sqrt{4\,\pi\,\Theta - (\Theta)^2}}$$

$$\text{Solve}\left[r == \frac{2 * c * 6\,((180/\pi)\,\theta) * \pi}{\sqrt{4\,\pi\,\theta - (\theta)^2}}, \theta\right]$$

A Paper on Leonard Euler' s Formula in Natural Scientific Thought

To show that the ideas presented through the ontological cone (an analogy to the gestalt of perception through the sense of being), are applicable to the Euler equation is the purpose of this section.

```
ⅇ^(ⅈ β) = Cos[β] + ⅈ Sin[β]
```

```
ⅇ^(ⅈ θ) = Cos[θ] + ⅈ Sin[θ]

The Four Noble Truths of θ, The Hologram of Vision

by Parker Matthew Davis Emmerson

Postulates, polar coordinates, etc.

$$\text{Sin}[\beta] = \eta / r \tag{124}$$

$$\text{Tan}[\beta] = \eta / r_1 \tag{125}$$

$$\text{Cos}[\beta] = r_1 / r \tag{126}$$

$$\eta = r\,\text{Sin}[\beta] \tag{127}$$

$r = \eta / \text{Sin}[\beta]$

$\text{Cos}[\beta] = r_1 / r = r_1 / (\eta / \text{Sin}[\beta])$

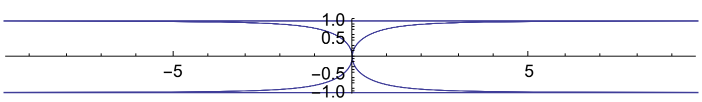
$\text{Simplify}[r_1 / (\eta / \text{Sin}[\beta])]$

$$\frac{\text{Sin}[\beta]\, r_1}{\eta}$$

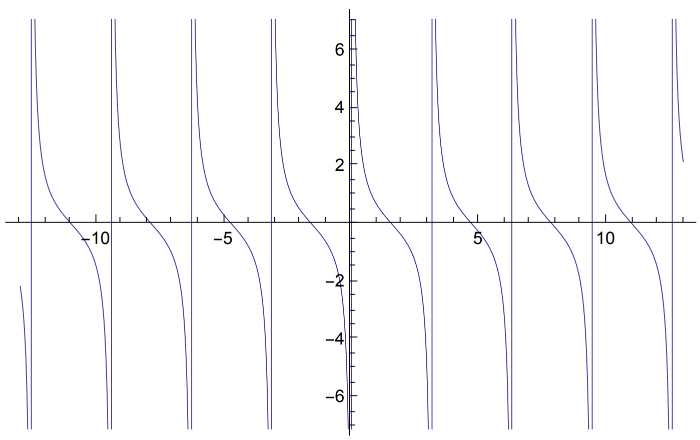
$$\frac{\text{Sin}[\beta]\, r_1}{\eta} = \text{Cos}[\beta]$$

$$\text{Cos}[\beta] / \text{Sin}[\beta] = \frac{r_1}{\eta}$$

$\text{PolarPlot}[\text{Cos}[\beta] / \text{Sin}[\beta], \{\beta, -13, 13\}]$



$\text{Plot}[\text{Cos}[\beta] / \text{Sin}[\beta], \{\beta, -13, 13\}]$



$$\text{Solve}\left[\theta\, r == 2\,\pi\,(r) - 2\,\pi\,\sqrt{((r)\,\hat{}\,2 - \eta\,\hat{}\,2)},\ \eta\right]$$

$$\left\{\left\{\eta \to -\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}\right\},\ \left\{\eta \to \frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}\right\}\right\}$$

go from the philosophy to the axioms / geometric description, backed up with psych and philosophy

take the geometric situation described and working out what follows.

$$\eta == \frac{\sqrt{4\,\pi\,\left(\frac{2\,\pi\,r\,\mathrm{Sin}[\beta]}{\sqrt{4\,\pi\,\Theta-\Theta^2}}\right)^2\Theta-\left(\frac{2\,\pi\,r\,\mathrm{Sin}[\beta]}{\sqrt{4\,\pi\,\Theta-\Theta^2}}\right)^2\Theta^2}}{2\,\pi} = \mathrm{rate} * \mathrm{time} = \mathrm{rate} * 6\,((180/\pi)\,\Theta) \tag{128}$$

$$\left\{\left\{r \to -\frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\Theta-\Theta^2}}\right\}, \left\{r \to \frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\Theta-\Theta^2}}\right\}\right\} \tag{129}$$

$$\left\{\left\{r_1 \to -\sqrt{r^2-\eta^2}\right\}, \left\{r_1 \to \sqrt{r^2-\eta^2}\right\}\right\} \tag{130}$$

$$r_1 = \sqrt{r^2-\eta^2} = r\,\mathrm{Cos}[\beta] \tag{131}$$

There are special cases of the system when $h = r$, when $\beta = \Theta$, when $r_1 = r$ (the initial condition), and when $r_1 = h$.

Usually, we would think that $\beta \leq \pi/2$, whereas $\Theta \leq 4\,\pi$. (132)

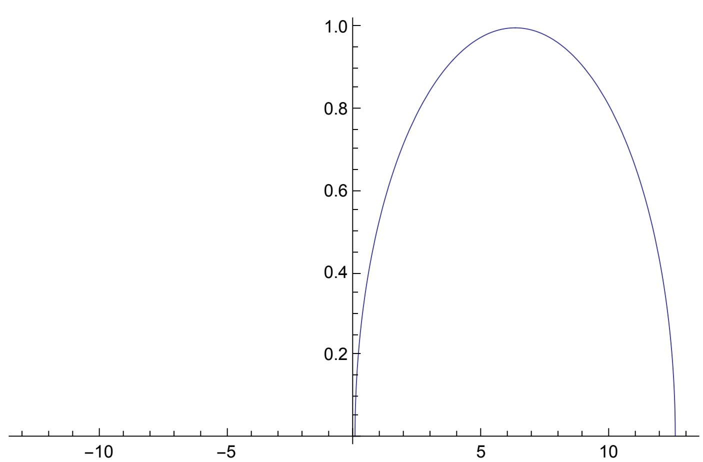
We can show that $\Theta \leq 4\,\pi$ by setting r equal to one in the equation $r = \frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\Theta-\Theta^2}}$

$\beta \leq \pi/2$ comes from the fact that when the cone folds all the way up, it makes a right angle with the x axis.

Solve$\left[1 == \frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta-\theta^2}}, \eta\right]$

$$\left\{\left\{\eta \to \frac{\sqrt{(4\,\pi-\Theta)\,\Theta}}{2\,\pi}\right\}\right\}$$

Plot$\left[\frac{\sqrt{(4\,\pi-\theta)\,\theta}}{2\,\pi}, \{\theta, -13, 13\}\right]$



There is a particularly interesting special case of the system, however,

when the square of the height of the cone is equal to the area of the base of the cone.

So What's the Point? How to Find the Four Noble θ Solutions, or Truths of θ.

$$r_1 = \sqrt{r^2 - \eta^2}$$

$$\eta = r\,\mathrm{Sin}[\beta]$$

$$\left\{\left\{\eta \to -\frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi}\right\}, \left\{\eta \to \frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi}\right\}\right\}$$

$$\left(\frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi}\right)\text{^}2 = \eta\text{^}2$$

$$\left(\frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi}\right)\text{^}2$$

$$\frac{4\pi r^2 \theta - r^2 \theta^2}{4\pi^2}$$

$$\frac{4\pi r^2 \theta - r^2 \theta^2}{4\pi^2} = \pi\,(r_1\text{^}2) = \pi\left(r^2 - \eta^2\right) = \pi\left(r^2 - \frac{4\pi r^2 \theta - r^2 \theta^2}{4\pi^2}\right)$$

$$\mathrm{Solve}\left[\pi\left(r^2 - \frac{4\pi r^2 \theta - r^2 \theta^2}{4\pi^2}\right) == \frac{4\pi r^2 \theta - r^2 \theta^2}{4\pi^2}, \theta\right]$$

$$\left\{\left\{\theta \to \frac{4\pi + 4\pi^2 - \sqrt{16\pi^2 + 16\pi^3}}{2 + 2\pi}\right\}, \left\{\theta \to \frac{4\pi + 4\pi^2 + \sqrt{16\pi^2 + 16\pi^3}}{2\,(1 + \pi)}\right\}\right\}$$

$$N\left[\frac{4\pi + 4\pi^2 - \sqrt{16\pi^2 + 16\pi^3}}{2 + 2\pi}\right]$$

3.19576

$$N\left[\frac{4\pi + 4\pi^2 + \sqrt{16\pi^2 + 16\pi^3}}{2\,(1 + \pi)}\right]$$

9.37061

$$\mathrm{Solve}\left[\pi\left(r^2 - \frac{4\pi r^2 \theta - r^2 \theta^2}{4\pi^2}\right) == \frac{4\pi r^2 \theta - r^2 \theta^2}{4\pi^2}, r\right]$$

$$\{\{r \to 0\}, \{r \to 0\}\}$$

Thus, we have shown that a point, by definition, is the place at which the square of the height of a cone is equal to the area of the base of the cone when talking about a transition or even a translation of

points along an axis. We have also shown that the point has an inherent angle of $\frac{4\pi+4\pi^2+\sqrt{16\pi^2+16\pi^3}}{2(1+\pi)}$ and $\frac{4\pi+4\pi^2-\sqrt{16\pi^2+16\pi^3}}{2+2\pi}$ radians.

So, what does θ r look like now?

$$\theta\, r = r\,\frac{4\pi+4\pi^2+\sqrt{16\pi^2+16\pi^3}}{2(1+\pi)},\ r\,\frac{4\pi+4\pi^2-\sqrt{16\pi^2+16\pi^3}}{2+2\pi}$$

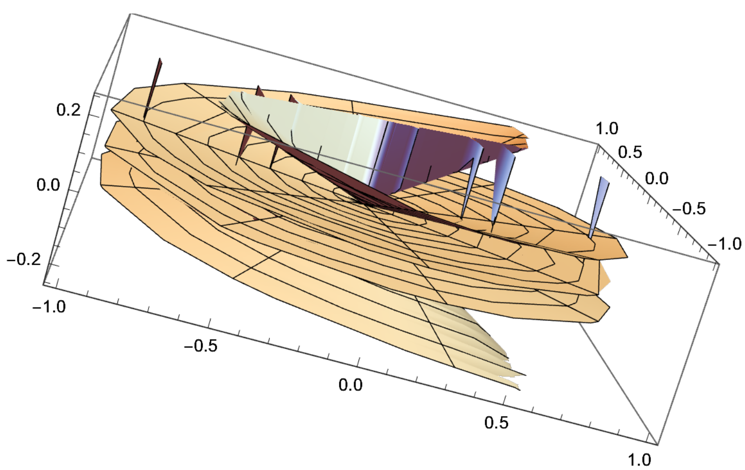
$$v = \lambda\, v = r\,(1/(1080/\pi)\,\theta) = D\left[\frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}, \theta\right]$$

The velocity of η is equal to the first derivative of η with respect to time.

$$D\left[\frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}, \theta\right]$$

$$\frac{4\pi r^2 - 2 r^2\theta}{4\pi\sqrt{4\pi r^2\theta - r^2\theta^2}}$$

$$\text{RevolutionPlot3D}\left[\frac{4\pi r^2 - 2r^2\theta}{4\pi\sqrt{4\pi r^2\theta - r^2\theta^2}}, \{r, -1, 1\}, \{\theta, -13, 13\}\right]$$



$$\text{Solve}\left[\frac{4\pi r^2 - 2r^2\theta}{4\pi\sqrt{4\pi r^2\theta - r^2\theta^2}} == r\,(1/(1080/\pi)\,\theta), \theta\right]$$

$$\Bigg\{\Bigg\{\theta \to \pi - \frac{1}{2}\sqrt{\Bigg(-\frac{194\,400}{\pi^4} + 4\pi^2 + \frac{1}{\pi^4}\,28\,343\,520\,000\,\Big(2\Big/\Big(49\,589\,822\,592\,000\,000 + 503\,884\,800\,\pi^{12} + \sqrt{\left(49\,975\,115\,677\,610\,803\,200\,000\,000\,\pi^{12} + 253\,899\,891\,671\,040\,000\,\pi^{24}\right)}\Big)\Big)^{1/3} + \frac{1}{3\pi^4}\Big(\frac{1}{2}\Big(49\,589\,822\,592\,000\,000 + 503\,884\,800\,\pi^{12} + \sqrt{\left(49\,975\,115\,677\,610\,803\,200\,000\,000\,\pi^{12} + 253\,899\,891\,671\,040\,000\,\pi^{24}\right)}\Big)\Big)^{1/3}\Bigg) -$$

Contour is said to be the experience of this kind of polar equation from information available in light. Light is interpreted in the polar coordinate system by a human being when perception occurs. How it is

interpreted depends partially on how you see something. For instance, I can see this graphed contour like a cylinder or two spheres. We call this a conisphilinder. It's holographic characteristic is the first special case.

The Geometric Pattern of Perception of the Moon from beneath the Legs.

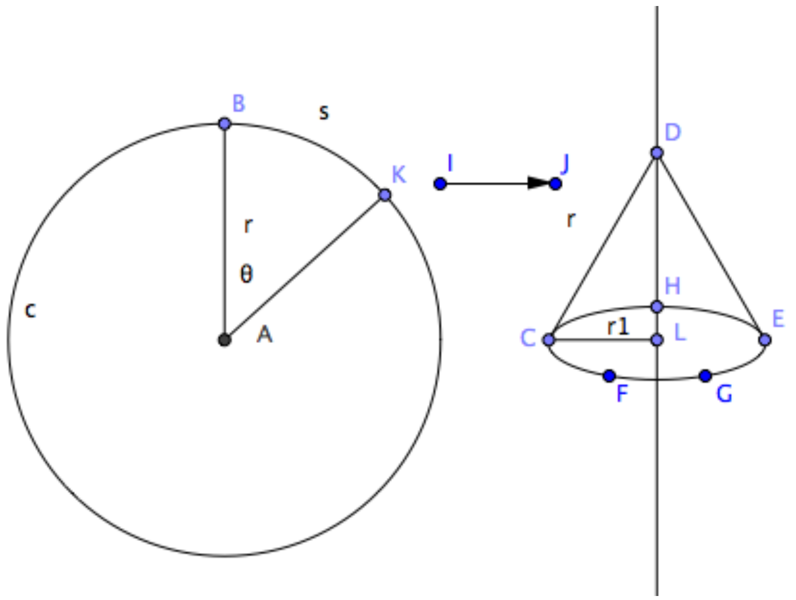
by Parker Emmerson

From Perception of the Environment with Tom Toleno

Perception would and could only be perceived as the inception and or acceptance of the information provided by the individual or individuals through any giving persona section of reality. In this paper, I will discuss how Gibson’s theory of the ambient optic array, in combination with mathematical inquiry of the experience, will act like a thought experiment for understanding the reason behind the illusion that, when you look at the moon through your legs, you will see that it looks smaller than when you see it from a standing position. Specifically, we will attempt to answer the question of, "how can perceived change in size, theoretically relating to a change in distance, be accounted for even though the change in distance does not actually occur"?

When people look up in the sky from a standing position, a clear and accessible visual structure presents the opportunity for relatively accurate depth perception and size discernment. The object being perceived takes the shape of a circle or orb in the sky, which is the moon. However, when the body is turned upside down and the eye strains to move about searching for or focusing on external stimuli, the visual structure is depleted. It was shown that by G. M. Stratton that, for voluntary eye motions, following a moving object was anything but predicatble. The conclusion from Stratton's experiments pertains to the phenomenon of the moon's looking smaller from upside down beneath the legs, because it shows us that, "reception of visual structures is possible only for the eye at rest" (The Perceptual World by Wolfgang Metzger 63). We will now use mathematics to describe the visual structure of the variables relating to depth perception and measurement of the size of a circle or orb.

First, we postulate that :



The diagram is not drawn to scale with regard to theta or an actual transformation of this sort. This diagram is a representation of a geometric structure and a system that has complex implications. If an object or wavelength progresses through the height of the cone, it is said to be traveling through theta in terms of time. However, it should be noted that the circle does not have to fold all the way up in order for the max height of r to be achieved for variables to maintain their correlation. This is said to be an *invariance* of the system. The position is also said to have an initial radius of a max of the height of the cone during a given instance. It is a structure that I propose may be present in every point of the ambient optic array, and one that also has clear cut geometric relations *through* the folding of space-time. It also acts like an observable metaphor for how discernment of the size of a massive orb in space occurs and can change with context.

The parameters of the system for the purposes of this discussion are:

$C = 2\pi r$

This is the circumference of our initial circle of radius r

$C_2 = 2\pi r_1$

This is the circumference of our second circle, the base of the cone, of radius r_1

$r^2 = r_1^2 + h^2$

This is the initial radius squared expressed as the slant of the cone in terms of the height of the cone, h, and the radius of the base of the cone, r_1

$r = \sqrt{(r_1^2 + h^2)}$

$s = \theta r$

$s / \theta = r$

The arc length taken out of a circle at a given time is =

$t = C - C_2 = 2\pi r - 2\pi r_1 = \theta r \quad \rightarrow$ Equation 7

$r_1^2 == r^2 - h^2$

$r_1 = \sqrt{(r^2 - h^2)}$

$h < r$

τ = time
1 second = 6 degrees
$\tau = 6\,\theta$

I will now do some algebra to conclude what the height of the cone is in terms of the initial parameters. It can eventually be reduced to a single variable.

```
Solve[r1^2 + h^2 == r^2, h]
```

$$\left\{\left\{h \to -\sqrt{r^2 - r_1^2}\right\}, \left\{h \to \sqrt{r^2 - r_1^2}\right\}\right\}$$

```
(t / θ) = r
```

We will propose that for our system, it is true that this correlation pertains :

$$\text{Solve}\left[\theta == \left(\left(2\,\pi\,(r) - 2\,\pi\sqrt{\left((r)\,^\wedge 2 - \left(\left(\left(\frac{2\,\sqrt{r^2\,(2\,\pi - (\theta))\,(\theta)}}{\sqrt{r^2\,(4\,\pi - \theta)\,\theta}}\right)\left(\frac{\sqrt{(2\,(r))^2\,(2\,\pi - \theta)\,\theta}}{2\,\pi}\right)\right)^\wedge 2\right)\right)}\right)\Big/ r\right), \theta\right]$$

$$\left\{\{\theta \to 0\}, \left\{\theta \to \frac{4\,\pi}{3}\right\}, \left\{\theta \to \frac{12\,\pi}{5}\right\}\right\}$$

$$\left\{\left\{h \to -\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}\right\}, \left\{h \to \frac{\sqrt{4\,\pi\,(1)^2\,\theta - (1)^2\,\theta^2}}{2\,\pi}\right\}\right\}$$

$$\text{PolarMap}\left[\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}, \{-1, 1\}, \{-13, 13\}\right]$$

$$\text{PolarMap}\left[\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}, \{-1, 1\}, \{-13, 13\}\right]$$

$$\frac{\sqrt{4\,\pi\,(r)^2\,\theta - (1)^2\,\theta^2}}{2\,\pi} == x\,($$

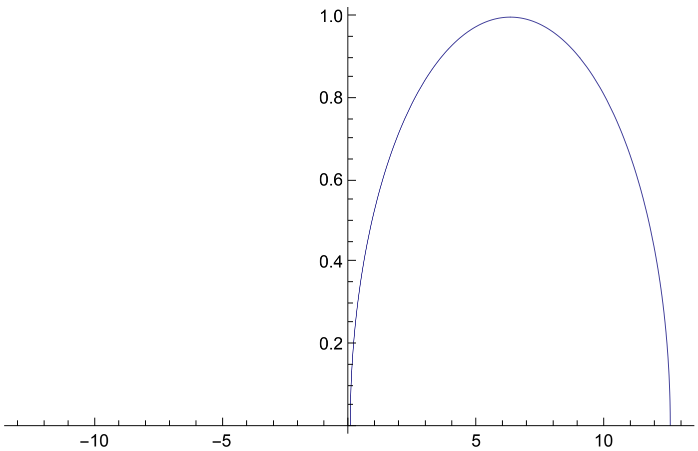
$$\text{Simplify}\left[\frac{\sqrt{4\,\pi\,(r)^2\,\theta - (r)^2\,\theta^2}}{2\,\pi}\right]$$

$$\frac{\sqrt{r^2\,(4\,\pi - \theta)\,\theta}}{2\,\pi}$$

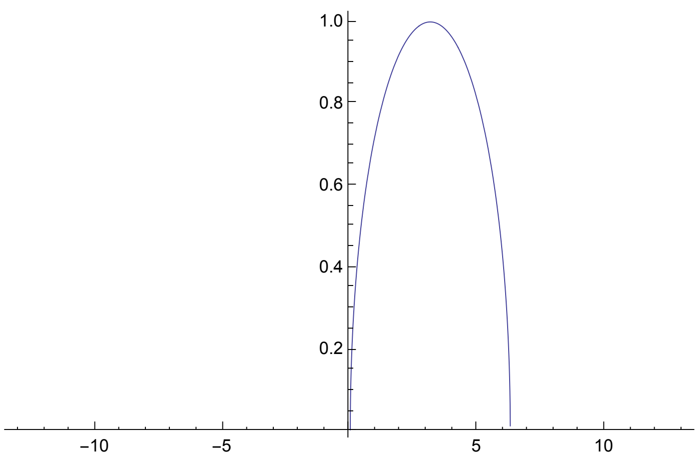
$$\text{Solve}\left[\frac{\sqrt{(2\,r)^2\,(2\,\pi-\theta)\,\theta}}{2\,\pi}==x\,\frac{\sqrt{r^2\,(4\,\pi-\theta)\,\theta}}{2\,\pi},\,x\right]$$

$$\left\{\left\{x\to\frac{2\,\sqrt{r^2\,(2\,\pi-\theta)\,\theta}}{\sqrt{r^2\,(4\,\pi-\theta)\,\theta}}\right\}\right\}$$

$$\text{Plot}\left[\frac{\sqrt{4\,\pi\,(1)^2\,\theta-(1)^2\,\theta^2}}{2\,\pi},\,\{\theta,\,-13,\,13\}\right]$$



$$\text{Plot}\left[\frac{\sqrt{2\,\pi\,(1)^2\,\theta-(1)^2\,\theta^2}}{\pi},\,\{\theta,\,-13,\,13\}\right]$$



$$\frac{2\,\sqrt{r^2\,(2\,\pi-\theta)\,\theta}}{\sqrt{r^2\,(4\,\pi-\theta)\,\theta}}=x$$

$$t==\pi\,(r)-2\,\pi\,\sqrt{\left((r)\,\hat{}\,2-\left(\frac{2\,\sqrt{r^2\,(2\,\pi-\theta)\,\theta}}{\sqrt{r^2\,(4\,\pi-\theta)\,\theta}}\,h\right)\hat{}\,2\right)}$$

$$\pi\ (1) - 2\,\pi\ \sqrt{\left((1)\ \char94 2 - \left(\frac{2\ \sqrt{1^2\ (2\,\pi - \theta)\ \theta}}{\sqrt{1^2\ (4\,\pi - \theta)\ \theta}}\ h\right)\char94 2\right)}$$

$$t = C - C_2 = 2\,\pi r - 2\,\pi r_1 = 2\,\pi\ (r) - 2\,\pi\ \sqrt{((r)\ \char94 2 - h\char94 2)}$$

$$t == 2\,\pi\ (t/\theta) - 2\,\pi\ \sqrt{((t/\theta)\ \char94 2 - h\char94 2)}$$

Add $2\,\pi\ \sqrt{((r)\ \char94 2 - h\char94 2)}$ to both sides

$$t + 2\,\pi\ \sqrt{((t/\theta)\ \char94 2 - h\char94 2)} = 2\,\pi\ (t/\theta)$$

Subtract t from both sides and remember that $(t/\theta) = r$

$$2\,\pi\ \sqrt{((t/\theta)\ \char94 2 - (h\char94 2))} = 2\,\pi\ (t/\theta) - t = 2\,\pi r - t$$

Divide by $2\,\pi$ on both sides.

$$(t/\theta) - t/(2\,\pi) = (r) - t/(2\,\pi) = \sqrt{((t/\theta)\ \char94 2 - (h\char94 2))} = \sqrt{((r)\ \char94 2 - (h\char94 2))} = r_1$$

$$(r) - t/(2\,\pi) = \sqrt{((t/\theta)\ \char94 2 - (h\char94 2))}$$

Square both sides. Substitute : $(t/\theta) = r$

$$((t/\theta) - (t/(2\,\pi)))\ \char94 2 = ((r) - (t/(2\,\pi)))\ \char94 2 = ((t/\theta)\ \char94 2 - (h\char94 2)) = (r_1\char94 2)$$

$$((r) - (t/(2\,\pi)))\ \char94 2 = ((r)\ \char94 2 - (h\char94 2))$$

Add h^2 to both sides.

```
((r) - (t/(2 π)))^2 + (h^2) = (r)^2
```

Substitute : θ r=t

```
((t/θ) - (t/(2 π)))^2  = ((r) - (θ*r/(2 π)))^2
```

$$((r) - (\theta * r/(2\,\pi)))\ \char94 2$$

$$\left(r - \frac{r\,\theta}{2\,\pi}\right)^2$$

$$\text{Expand}\left[\left(r - \frac{r\,\theta}{2\,\pi}\right)^2\right]$$

$$r^2 - \frac{r^2\,\theta}{\pi} + \frac{r^2\,\theta^2}{4\,\pi^2}$$

$$r^2 - \frac{r^2\,\theta}{\pi} + \frac{r^2\,\theta^2}{4\,\pi^2} + h\char94 2 = ((r) - (t/2\,\pi))\ \char94 2 + (h\char94 2) = r\char94 2$$

$$(r\char94 2) - \left(r^2 - \frac{r^2\,\theta}{\pi} + \frac{r^2\,\theta^2}{4\,\pi^2}\right) = h\char94 2$$

$$\text{Simplify}\left[(r\char94 2) - \left(r^2 - \frac{r^2\,\theta}{\pi} + \frac{r^2\,\theta^2}{4\,\pi^2}\right)\right]$$

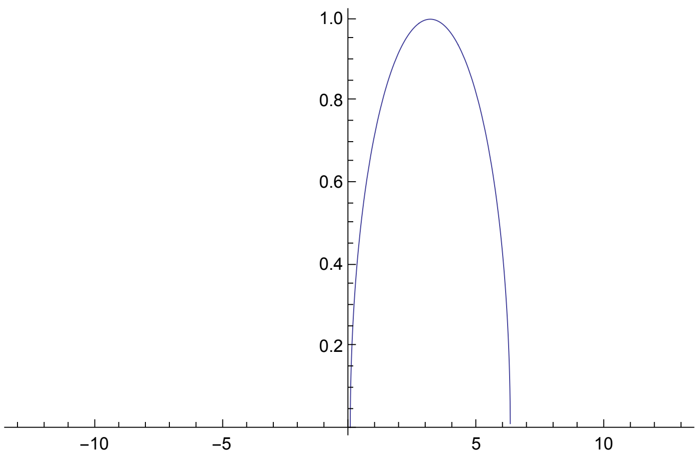
$$h\wedge 2 = \frac{r^2\,(4\,\pi - \theta)\,\theta}{4\,\pi^2}$$

$$\sqrt{\left[\frac{r^2\,\theta}{\pi} - \frac{r^2\,\theta^2}{4\,\pi^2}\right]} = h$$

$$\text{Simplify}\left[\sqrt{\frac{r^2\,\theta}{\pi} - \frac{r^2\,\theta^2}{4\,\pi^2}}\right]$$

$$\frac{\sqrt{r^2\,(4\,\pi - \theta)\,\theta}}{2\,\pi}$$

$$\text{Plot}\left[\frac{\sqrt{(2 * r)^2\,(2\,\pi - \theta)\,\theta}}{2\,\pi}, \{\theta, -13, 13\}\right]$$



We alter the equation to fix it, because what we find with what we found was missing a coefficient.

$$\frac{\sqrt{((2\,r))^2\,(4\,\pi - \theta)\,\theta}}{\pi}$$

$$\frac{\sqrt{(2\,r)^2\,(4\,\pi - \theta)\,\theta}}{2\,\pi}$$

There are methods for solving this equation so that we know what r is in terms of theta. We will not use them for our immediate introspection. However, an additional postulate should be noted. The

initial discernment of the moon's radius is a measurement of one. The moon will be said to have an initial radius of one, because it is the first measurement taken, and any multiplier of other scaling methods could be applied to the initial designation of the radius' being equal to one.

When we look at the moon from beneath the legs, we see an object in relation to contour. The object, however, is a heavenly body, and discernment of its actual size is more difficult than objects on the ground. In Gibson' s terminology, what happens during the perception of the moon when standing up is that, although the object, "neither approaches nor recedes from the point of observation, and no change occurs within the contour corresponding object" (Gibson, 103), there is a perceived magnification. In the optical array, when perceiving the moon, we can suggest that there must be a decretion in the optical structure, i.e. framing by the legs (deletion of optical structure relating to the contour of the moon), an therefore a decrease of the moon' s edge contour from the standing position. This refers to a disturbance in the perspective.

When we look from beneath our legs, not only do our eyes have to strain to look upward (creating hypocycloid, or syccatic eye movements), but also they switch positions and invert. The phenomenon occurs within the sphere of an individual's perceptual space. From the notion of mirroring (due to inverted eye positions), we notice that the derivative of the actual geometric element of depth inceives a perceptual illusion of depth change independently from within the space of an individual and their translation of the existence of objects in real space into subjective experience upon reception of the external sensation of light.

The moon phenomenon is some evidence for the old Buddhist koan that suggests that the mind really may be that which moves, because the first derivative of height would be velocity with respect to our version of the time variable.

In order to model this phenomenon, we will use the hypocycloid to model the syccatic eye movements, and the derivative of the height (due to mirroring of the individual's perceptual space) to find the exact amount of decretion of contour around the perceived moon when looking upside down from beneath your legs.

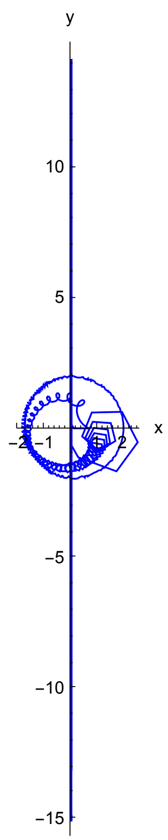
$$\frac{4\pi - 2\theta}{4\pi\ \sqrt{(4\pi - \theta)\ \theta}}$$



We can interpret this to show us the way in which contour gives us the perception of depth in our environment, and that, when the contour around an object is eroded by a change in the environmental

factors, it looks smaller. I think the graph should be interpreted to say that there is the amount of contour is even on all edges of the object when the average is found for the size of a loop.

Science offers to humanities the language by which they may discuss the parameters of the human being in its beauty, symmetry, and sense of place. A human being is a material being, though this material ought not to be thought of as a separate element from its geometry. If we think about it, we are like spheres.Our bodies and minds both have a centralized locale in the environment. A body of knowledge grows to more accurately describe the being who asked the question of individual meaning.The individuality of this being, however, must only be considered to be truly individual from the rest of the universe in which it inhabits. Science can offer a path to the humanitarian study in which each element of the impressions made by a being is an ever - expanding body of connective knowledge. Science shows the humanities how they are symbolically present through the entire realm of being. The arts, in this way, are like the tissue or sinew of a structure for expanding and exploring the cognition and being of the individual.

A Series of Useful Functions for the Student of Perception

by Parker Emmerson including influence from conversations with Tom Toleno, Andrew Berisha, and Alsten Daniels

© Parker Emmerson October 25, 2009

This paper will refer to the book, *The Blackwell Reading in Philosophy Publication Entitled Perception* edited by Robert Schwartz. It is referred to throughout the paper as (BRP, Page Number). The book is an anthology of multiple thinkers in the field of perceptual philosophy.

This paper will refer to the book, *Phenomenology of Perception* by Merleau-Ponty. It is referred to throughout the paper as (PoP, Page Number)

I. Intro

In this series of chapters, we will discuss how the visual system perceives the world through samples of the ambient optic array. On some levels, we can say that arithmetic and the body of science called mathematics does not depend at all on any psychological process. Husserl was the first to specifically begin exploring the framework for transcendental phenomenology by discussing this truth. However, on a more in depth level, applied mathematics depends greatly on the observer. How is anyone to come to any meaningful series of relations without using some cognitive process of observation or at least realizing that their expression of truth depends on observation? When we say 1+1=2, this is not a truth that depends on cognition. It has meaning that already exists in the world. However, when we observe a truth about the universe that is slightly more complex and depends on the phenomenon of validity of our perceptions in space, we observe how different elements of a system fit together by necessity. There is no longer one direct path to showing meaning already exists in the world, but a series of valid expressions that we can relate to one another in order to visualize the meaning of the structuring of light, substance, time or space and gain knowledge about expressions, which are useful tools for the computational approach to visual perception.

Gibson said in Perception of the Visual World, that "Space perception (from which time is inseparable) is not, therefore, a division of the subject matter of perception but the first problem to consider, without a solution for which other problems remain unclear" (vii). He goes on to say that "What we lack, however, is an application of the psychophysical methods to perception" (viii). Psychophysical methods of perception are related to the environment in which perception evolved to its current level of accuracy, quarkiness, and illusionary aspects. Our perception of time is related to the environmental description of time, which is cyclic and continues out in every direction. We have evolved with a cyclic

percepiton of time through the seasons, day, night, and cycles of the moon. Light effects the seasons, because it allows plants to grow, it gives warmth to the air, and it influences our sleep schedules.

It is a purely theoretical notion that the eye is ever in a fixed position. Eye movements are involuntary, but can be controlled. However, making one' s eye very still is difficult. We still see depth with one eye, and this is because the eye makes motions to receive the impression of depth to perception from the environment, because it associates spatiotemporal continuity to observations of the mind in addition to detecting the gradient of light and the shading involved relating to the hue of objects (the array of color). The stimulus of light is an external stimulus. It is one whose nature is not yet known. The physicist may think of it in terms of wave-particle duality. Yet, with the following mathematical account, I would like to strongly encourage thinkers in the field of theoretical physics to consider other interpretations of light. Interpretations that do not pin it down to saying, "it is a wave, it is a particle, it is both of these, and at the same time a duality," are important for developing progressive scientific theories. We may not know exactly why light is what it is, but we can know how it travels in form and visualization of the shape of its pattern.

II. Postulates and Strucuture for Notating a Sample of the Ambient Optic Array

$C = 2\pi r$
This is the circumference of our initial circle with radius r. (133)

$C_2 = 2\pi r_1$
This is the circumference of our second circle,
the base of the cone with radius r_1. (134)

$r^2 = r_1^2 + \eta^2$
This is the initial radius squared expressed during transition to be the slant of the cone in terms of the height of the cone, η, and the radius of the base of the cone, r_1. (135)

$r = \pm\sqrt{(r_1^2 + \eta^2)}$
The initial radius can be calculated through the Pythagorean Theorem. The initial radius is always the slant of the cone when there is a cone. (136)

$s = \theta r$
In this expression,
we define an arc length to be equal to a radius of an angle measure,
θ, and that thus,
$s / \theta = r$ (137)

The arc length is expressed to be the difference of circumferences =
Initial Circumference − Circumference of the base of the cone =
$C - C_2 = 2\pi r - 2\pi r_1 = \theta r$ (138)

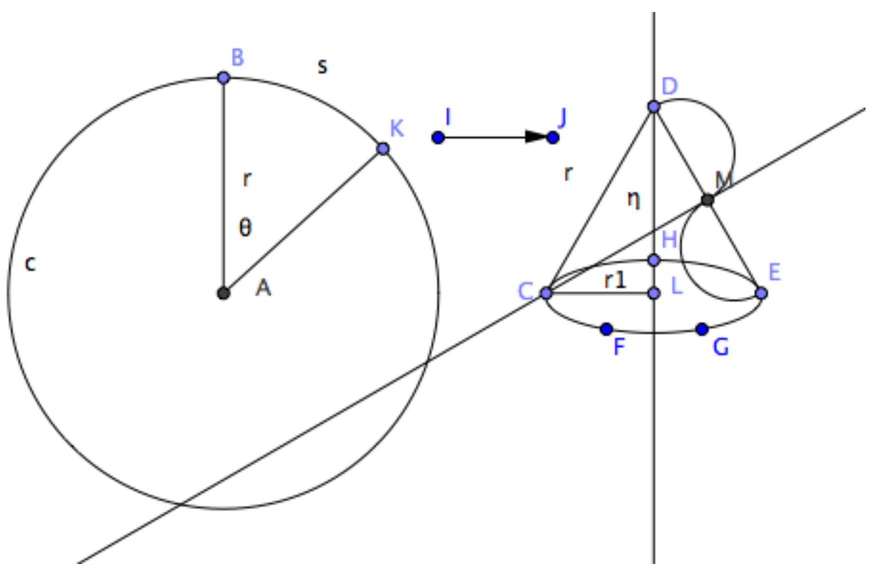
The radius of the base of a cone is equal to r_1,
and we can similarly solve for it.
r_1^2 == r^2 - η^2
$r_1 = \pm\sqrt{(r^2 - \eta^2)}$ (139)

In general, we say that $\eta \leq r$. More specifically,
when there is a cone, $\eta \leq r$, and when there is an initial circle, $\eta = r$. (140)

τ = time = τ (seconds) = $\theta / 2\pi$, because this ensures that
there is a maximum height of the cone equal to the initial radius. (141)

The elapse of 1 second = 1 revolution of the system
τ (seconds) = $\theta / 2\pi$
This equation ensures that when we put a revolution equal to 2π radians
into the equation for the angle theta, we will get one second.
We also note that any arc length can be
described by an angle of distance, θr. (142)

The model of space - time proposed only requires the acceptance of three fundamental truths. Firstly, that the length that comes from a change in circumferences can be equal to an arc length, secondly, that the Pythagorean theorem will hold up for making calculations within the modular, and thirdly, that ellapsed time is in terms of a cyclic continuum in the sense that we can measure it in terms of degrees of a circle.



The model describes the dynamic between subjective and objective reality in a simple and useful manner of perception (observation). The light is always considered to be directed toward the perceiver, whose locus of perception is either the point of the cone of the field of vision, or the reception of a combined wavelength of light when the height is equal to the initial radius. This provides a framework for notating how light travels, carrying information of the energy and velocity of light, which in turn provides the, "immediate basis for visual perception" (The Visual World, 55) when there is an

exposed receptor cell to the light. On receptors chemical compounds of receptors, Gibson has said that, "Like the substances used in photographic emulshions, these are capable of reacting differentially to the energy and wavelength of light" (The Visual World, 48), and that "nothing gets into the eye except radiant energy" (The Visual World, 54). He has also revealed that

The distance away from the area of the array that the perceiver samples during action of the visual system is equal to the height of the cone. Within the area of the sample, there is a contained amount of information about layout. The problem of including both the wave-length interpretation and the sampling interpretation within the structuring of the ambient array arises when we consider that the wavelength has not gone through the entire transition with respect to the ecological structure of the area when there is a sampling, but is realistically compiled by the visual system into an image. The problem can be partially resolved by considering that the visual system samples very many specific receptions of light or regions of layout from the sampled area within a general sample. These wave-lengths give information to the perceiver in terms of saturation, hue, brightness and thus, contour.

I will now do some algebra to conclude what the height of the cone is in terms of the initial parameters. It can eventually be reduced to a single variable when ideas like differentials of distance and frequency are included in the setting up of the equalities. This will lead to numerous *nested equations* that describe different parameters of the information being delivered within a visual system. We consider that the radius is equal to a single wavelength, not half a wavelength, because we are discussing the time it takes to travel a distance of one wavelength of light, and that wavelength travels through the height of the cone. Although, the shape of the diameter can later be shown through three-dimensional graphs to have the shape of a sine wave.

Solve[r_1^2 + η^2 == r^2, η]

$$\left\{\left\{\eta \to -\sqrt{r^2 - r_1^2}\right\}, \left\{\eta \to \sqrt{r^2 - r_1^2}\right\}\right\} \tag{143}$$

We say that the amount of θr = s, taken out of the circle is the change in the circle's circumference that is the base of the cone. The change is equal to s = 2πr-2πr $_1$.

Notice that θ = ((2 π r) / r) - ((2 π r $_1$) / r), because we divide by r on both sides.

We will focus on the positive solutions for the height of the cone.

Solve$\left[\eta == \sqrt{r^2 - r_1^2}, r_1\right]$

$$\left\{\left\{r_1 \to -\sqrt{r^2 - \eta^2}\right\}, \left\{r_1 \to \sqrt{r^2 - \eta^2}\right\}\right\} \tag{144}$$

This is the change in circumference with the substituted expression for r_1 in terms of h and r.

$$r\,\theta == s == 2\,\pi\,(r) - 2\,\pi\,\sqrt{((r)\text{^}2 - \eta\text{^}2)} = 2\,\pi\,(r) - 2\,\pi\,r_1 \tag{145}$$

θ == (2 π r) / r - (2 π r $_1$) / r) = ((2 π r) / r) - $\left(\left(2\,\pi\,\sqrt{-\eta^2 + r^2}\right) \big/ \, r\right)\Big)$

Solve$\left[\theta * r == 2\,\pi\,(r) - 2\,\pi\,\sqrt{((r)\text{^}2 - \eta\text{^}2)}, \eta\right]$

$$\left\{\left\{\eta \to -\frac{\sqrt{4 \pi r^2 \theta - r^2 \theta^2}}{2 \pi}\right\}, \left\{\eta \to \frac{\sqrt{4 \pi r^2 \theta - r^2 \theta^2}}{2 \pi}\right\}\right\} \quad (146)$$

$$\text{Solve}\left[\eta == \frac{\sqrt{4 \pi r^2 \theta - r^2 \theta^2}}{2 \pi}, r\right]$$

$$\left\{\left\{r \to -\frac{2 \pi \eta}{\sqrt{4 \pi \theta - \theta^2}}\right\}, \left\{r \to \frac{2 \pi \eta}{\sqrt{4 \pi \theta - \theta^2}}\right\}\right\} \quad (147)$$

```
Solve[θ * r == 2 π (r) - 2 π r1, r1]
```

$$\left\{\left\{r_1 \to \frac{2 \pi r - r \theta}{2 \pi}\right\}\right\}$$

III. Light through the Arc and Height

There is information available in the stimulation, so there is also information communicated to the perceiver. A change in the environment, when measuring size, is the revolution of the system in time through the distance of the combined, effective wavelength of light (a revolving of the system in time). The change of layout is ongoing, and a parameter of that structure is invariant, so the disruption in the array by contour, edge, etc. specifies the event. That event transitions and transforms through its path to the perceiver. Gibson said about the ambient array that, "The theory of direct perception presupposes the sampling of the ambient array by the ocular system. What is this sampling process?" (BRP 165).

$\left\{\left\{\eta \to -\frac{\sqrt{4 \pi r^2 \theta - r^2 \theta^2}}{2 \pi}\right\}, \left\{\eta \to \frac{\sqrt{4 \pi r^2 \theta - r^2 \theta^2}}{2 \pi}\right\}\right\}$ is the height of a cone in terms of a difference of circumferences, invariant through r, because it is always the slant of the cone and also the value that the base of the cone cannot reach, because once it reaches that value, it is no longer a cone, but collapses to a circle. (148)

Looking at solutions for θ from both the positive and negative solutions for reflective η.

By knowledge of total time through perception, we say that the absolute value of the negative solutions for angular transformation plus the absolute value of the positive solutions for theta are related to total time of perception in both a stationary and relative system. This is shown much later, but it is useful to note about the reflection of time for such purposes later in the paper.

$$\left\{\left\{\eta \to -\frac{\sqrt{4 \pi r^2 \theta - r^2 \theta^2}}{2 \pi}\right\}, \left\{\eta \to \frac{\sqrt{4 \pi r^2 \theta - r^2 \theta^2}}{2 \pi}\right\}\right\}$$

$$\text{Solve}\left[\eta == \frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}, \theta\right]$$

$$\left\{\left\{\theta \to \frac{2\,\pi\left(r^2 - \sqrt{r^4 - r^2\,\eta^2}\right)}{r^2}\right\}, \left\{\theta \to \frac{2\,\pi\left(r^2 + \sqrt{r^4 - r^2\,\eta^2}\right)}{r^2}\right\}\right\} \tag{149}$$

$$\text{Solve}\left[\eta == -\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}, \theta\right]$$

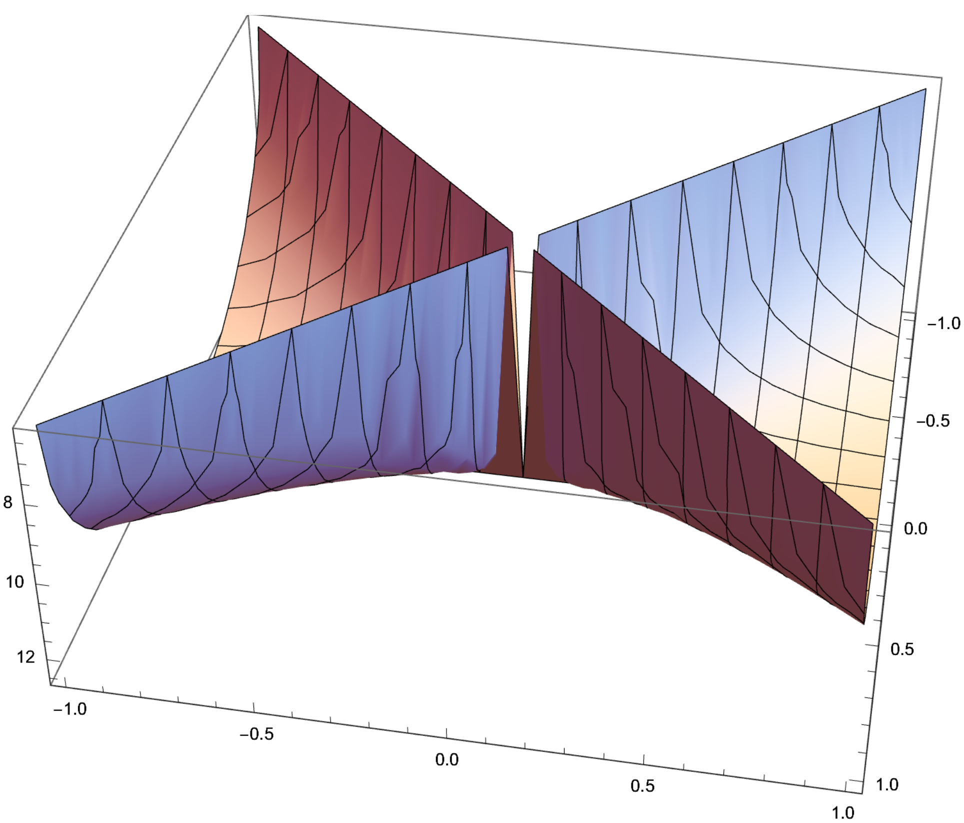
$$\left\{\left\{\theta \to \frac{2\,\pi\left(r^2 - \sqrt{r^4 - r^2\,\eta^2}\right)}{r^2}\right\}, \left\{\theta \to \frac{2\,\pi\left(r^2 + \sqrt{r^4 - r^2\,\eta^2}\right)}{r^2}\right\}\right\}$$

When the height of the cone reaches the locus of perception, the height has fulfilled its initial condition of the initial radius.

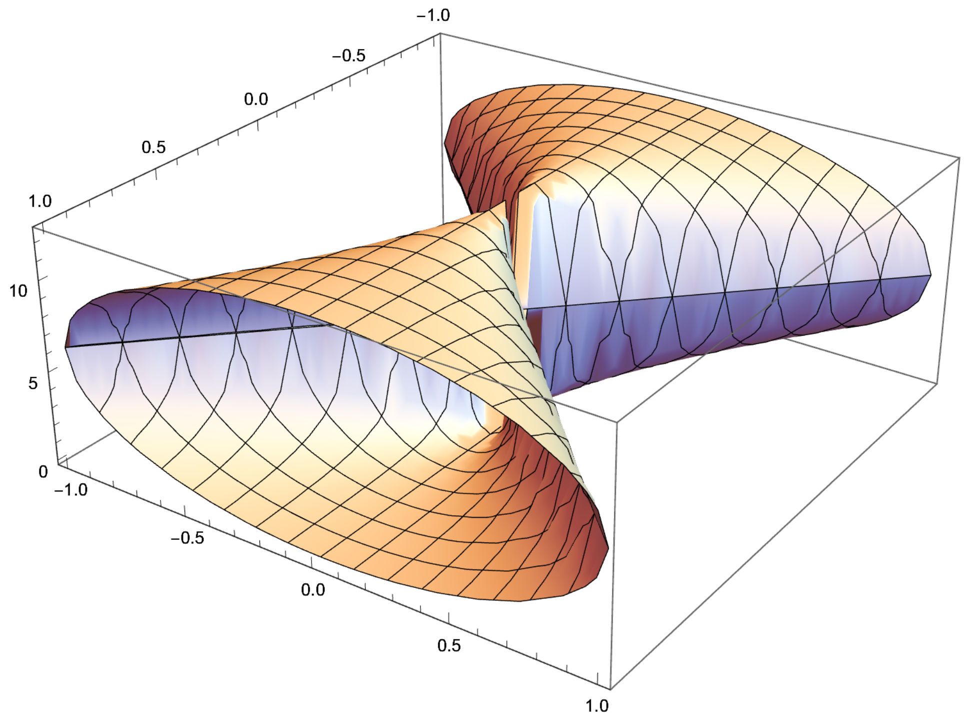
$$\text{Solve}\left[\text{Abs}\left[\frac{2\,\pi\left(r^2 - \sqrt{r^4 - r^2\,\eta^2}\right)}{r^2}\right] == \text{Abs}\left[\frac{2\,\pi\left(r^2 + \sqrt{r^4 - r^2\,\eta^2}\right)}{r^2}\right], \eta\right]$$

$$\{\{\eta \to -r\}, \{\eta \to r\}\}$$

$$\text{Plot3D}\left[\frac{2\,\pi\left(r^2 + \sqrt{r^4 - r^2\,\eta^2}\right)}{r^2}, \{r, -1, 1\}, \{\eta, -1, 1\}\right]$$



$$\text{Plot3D}\left[\left\{\frac{2\,\pi\left(r^2-\sqrt{r^4-r^2\,\eta^2}\right)}{r^2},\ \frac{2\,\pi\left(r^2+\sqrt{r^4-r^2\,\eta^2}\right)}{r^2}\right\},\ \{r,-1,1\},\ \{\eta,-1,1\}\right]$$



Looking at solutions for r from positive solution for η

$$\text{Solve}\left[\frac{\sqrt{4\,\pi\,r^2\,\theta-r^2\,\theta^2}}{2\,\pi}==\eta,\ r\right]$$

$$\left\{\left\{r\to-\frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\Theta-\Theta^2}}\right\},\ \left\{r\to\frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\Theta-\Theta^2}}\right\}\right\} \tag{150}$$

The radius in terms of the height of a cone is designated by the variable r.

$$\frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\Theta-\Theta^2}}=r=\frac{2\,\pi*r*\text{Sin}[\beta]}{\sqrt{4\,\pi\,\Theta-\Theta^2}} \tag{151}$$

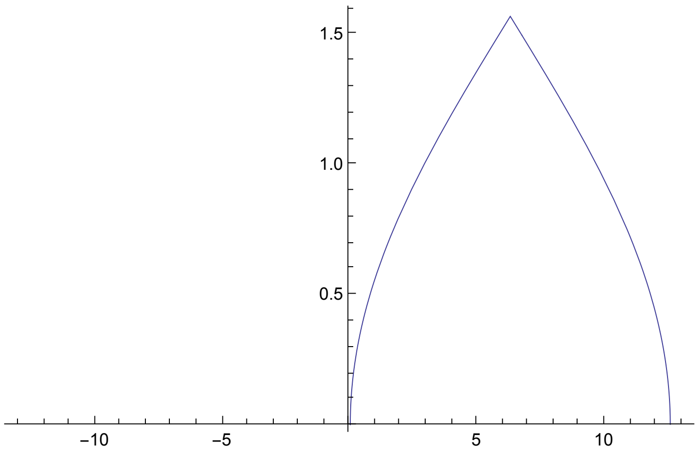
Note that whatever r is equal to, the equation simplifies to $1=\frac{2\,\pi\ \text{Sin}[\beta]}{\sqrt{4\,\pi\,\Theta-\Theta^2}}$ (152)

We can solve this equation for β, the angle made by the slant of the cone and the base of the cone, in terms of theta (the amount of angle involved in folding the circle up into the third dimension when the slant is always equal to the radius.

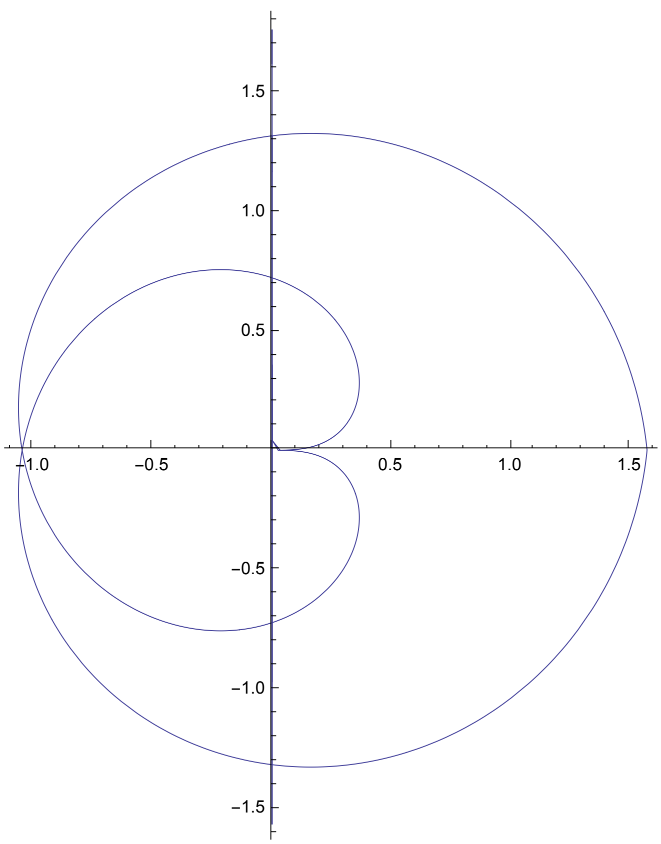
$$\text{Solve}\left[1==\frac{2\,\pi\ \text{Sin}[\beta]}{\sqrt{4\,\pi\,\theta-\theta^2}},\ \beta\right]$$

$$\left\{\left\{\beta \to \text{ArcSin}\left[\frac{\sqrt{(4\,\pi - \theta)\,\theta}}{2\,\pi}\right]\right\}\right\} \tag{153}$$

```
Plot[ArcSin[Sqrt[(4 π - θ) θ]/(2 π)], {θ, -13, 13}]
```

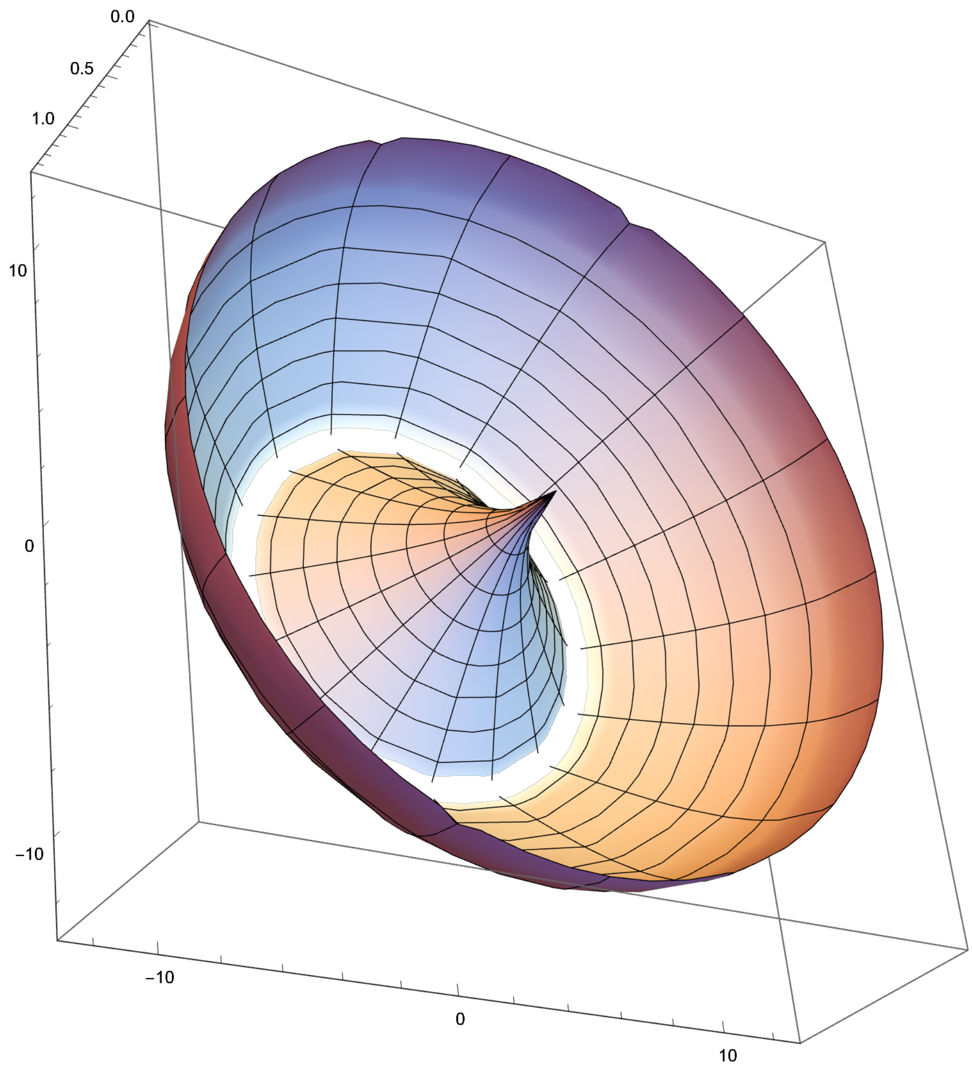


```
PolarPlot[{ArcSin[Sqrt[(4 π - θ) θ]/(2 π)]}, {θ, -13, 13}]
```



```
RevolutionPlot3D[ArcSin[Sqrt[(4 π - θ) θ] / (2 π)], {θ, -13, 13}]
```

$$\text{RevolutionPlot3D}\left[\text{ArcSin}\left[\frac{\sqrt{(4\,\pi-\theta)\,\theta}}{2\,\pi}\right],\,\{\theta,\,-13,\,13\}\right]$$



The single point in the field of optical flow, light traveling through the ambient array, I propose, is represented by the three dimensional revolution graph of a change in radius over time through transformation to being the height of the cone from the two angular variants of the system. A revolution delivers information to the perceiver given the intensity, hue, etc. of light. A single revolution of the system is equivalent to the flow of combined light in the ambient array at location of the station point of perception in the ambient optic array.

There are ways of solving for the radius in terms of purely the angle, *θ*. We will examine these nested sets of ways of understanding the point of view. By nested, we mean that depending on how in

depth one goes into observing the world or extrapolating a function of light in the array, one will see different visual representations of the structuring of that information that are more or less informationally dense. This will lead to a series of functions that give us introspection into the structuring of light in terms of a cyclic perspective on time. For the system, it is important to realize that in the normal course of parameterizing the motion in the case at hand, θ does not go beyond 4π (i.e. that it sends the height of the cone up to its maximum value and back down over the course of two revolutions of a circle), and that β would not be able to be easily thought of beyond π or 2π (it has a value of π at the maximum height of the transition, and a value of 2π once the cone comes back down from the height).

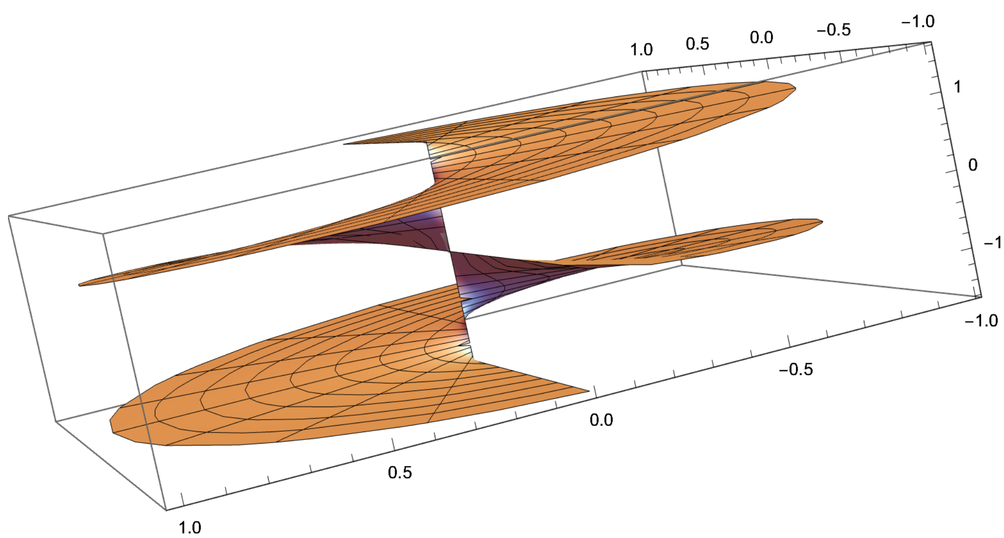
To understand more how these equations are related, we can make substitutions in various ways, all of which are not arbitrary. For instance, we know that the height of the cone is equal to two different functions. We can set these functions equal to each other and extrapolate different visions of the function.

$$\eta = \frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi} = r\,\mathrm{Sin}[\beta]$$

$$\mathrm{Solve}\left[\frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi} == r\,\mathrm{Sin}[\beta],\ \beta\right]$$

$$\left\{\left\{\beta \to \mathrm{ArcSin}\left[\frac{\sqrt{r^2 (4\pi - \theta)\,\theta}}{2\pi r}\right]\right\}\right\}$$

$$\mathrm{RevolutionPlot3D}\left[\mathrm{ArcSin}\left[\frac{\sqrt{r^2 (4\pi - \theta)\,\theta}}{2\pi r}\right], \{r, -1, 1\}, \{\theta, -2\pi, 2\pi\}\right]$$



$$\mathbf{Solve}\left[1 == \frac{2\,\pi\ \mathrm{Sin}[\beta]}{\sqrt{4\,\pi\,\theta - \theta^2}},\ \theta\right]$$

Gibson has said that, "The experience of the visual world is not compounded of a series of visual fields; no one is aware of the *sequence* but only of the total *scene*. Presumably this is because the ocular system detects the invariants over time that specify the scene" (BRP 166). Θ is the variable that is akin to the accumulated time of our system. It is an angle, and if we relate it to measurements made of time cyclically, like those of a clock, we can find how the invariant, which is the initial radius of the system, will guide the information communicated during the pickup of invariants. The time variable contains a contour based on the parameters of the system.

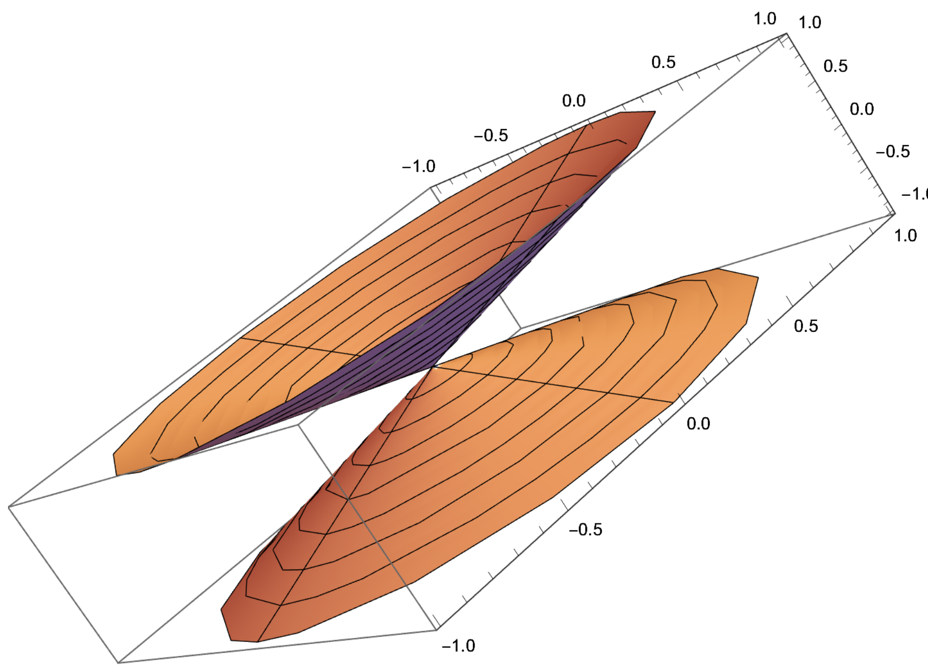
$$r = \frac{2\,\pi * r * \mathrm{Sin}[\beta]}{\sqrt{4\,\pi\,\theta - \theta^2}} = \frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta - \theta^2}}$$

The invariant is r, because it is always the slant of the cone during transition of a total combined effective wavelength that immediately effects the receptor. This means that if a wavelength were to change during travel through the modular of space-time due to being part of an ambient array, where light waves effect each other during their paths, the initial wavelength of light is the slant of the cone, even though the resulting height may be longer or shorter than the initial wavelength. What does this tell us about light and how it travels through space or effects a receiving perceiver? Knowledge of the initial condition of the system depends on the recognition of the receptor. To be the combination of constructive and interfering frequencies of light in the array, invariance of r contextually assures that the cummulative effect of the wavelength of light can only be discerened by the subective perceiver, whose perceptual locus is at the maximum height of the cone.

$$\beta = \text{ArcSin}\left[\frac{\sqrt{(4\pi - \theta)\ \theta}}{2\pi}\right]$$

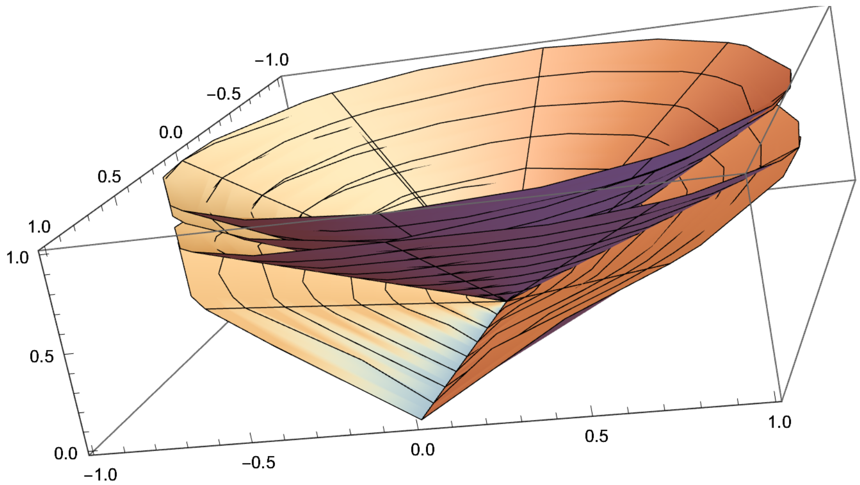
$$\frac{2\pi * r * \text{Sin}[\beta]}{\sqrt{4\pi\theta - \theta^2}} = \frac{2\pi * r * \text{Sin}\left[\text{ArcSin}\left[\frac{\sqrt{(4\pi-\theta)\ \theta}}{2\pi}\right]\right]}{\sqrt{4\pi\theta - \theta^2}}$$

$$\text{RevolutionPlot3D}\left[\frac{2\pi * r * \text{Sin}\left[\text{ArcSin}\left[\frac{\sqrt{(4\pi-\theta)\ \theta}}{2\pi}\right]\right]}{\sqrt{4\pi\theta - \theta^2}}, \{r, -1, 1\}, \{\theta, -4\pi, 4\pi\}\right]$$



$$\eta \to \frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}$$

$$\text{RevolutionPlot3D}\left[\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}, \{r, -1, 1\}, \{\theta, -4\,\pi, 4\,\pi\}\right]$$

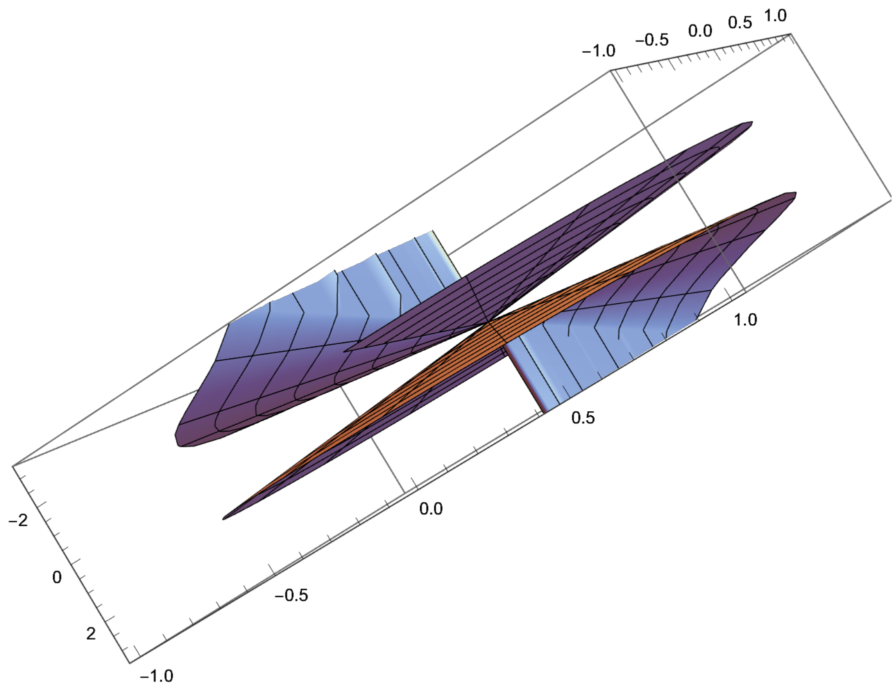


This is how the graph of the height of the cone in non - relativistic terms would look. It can be noted from the following graphs that within the parameters of the system, there is a similar graph to the relativistic length contraction transformation, but beyond the parameters of the system, the graphs begin to look slightly different.

This equation graphs the height of the cone by revolving r through theta. The structure of the array includes the distance, η. H can be equal to the new wavelength of light during a transition with changing wavelength of the structured substance, but it can also be a definitive distance of an object away from the perceiver.

$$r = \frac{2\,\pi * r * \text{Sin}[\beta]}{\sqrt{4\,\pi\,\theta - \theta^2}} = \frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta - \theta^2}}$$

$$\text{RevolutionPlot3D}\left[\frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta-\theta^{2}}},\ \{\eta,\ -1,\ 1\},\ \{\theta,\ -2\,\pi,\ 2\,\pi\}\right]$$



When we try to see what the structure of a single point of ambient light is, we acknowledge that this point is potentially infinitely far away at the horizon curve, and potentially infinitely divisible if the wavelength of the light gets infinitesimally small. When we stand on an infinitely large sphere, there is no way to tell how long or far away the horizon is. In order to get interpretations of meaning of other parameters of the system, we say that wavelength can change during a transition (a transition here means traveling the distance of one wavelength).

What can we tell from these models? We can see that parameters of wavelengths of substance traveling through space and time, like light, contain within them information that is already contoured, or from point to point draws out contour through recognizing trends of invariance. When we take a

different angle on them, we see the contour differently. This effect will be even more noticable in later models when we see that there is very subtle contour and shimmering.

It is possible that direct perception does not contradict information processing, because the pickup of information directly acknowledges that there is information in the layout of the world, transferred directly by light stimulus during the perceiving instance. That instance receives the delivery of information based on invariance. That delivery comes from a reflection off the contour through a combination of relations in the guidance of the flux of ambient light. Computational approaches simply would have to change their Philosophy to an ecological context and simply stick to observing the phenomenon of perception (i.e. what I see changing in the environment that can be correlated to objects or people in the world).

IV. The Analogy of a Change in Position Relating to a Change in Contour during the Pickup of Invariants through Time

Gibson has said that, "The theory of information pickup requires perceptual systems, not senses" (BRP 77). Gibson also relates the subtlety of the perceptual system to learning and time. He thinks that we continue learning to perceive in more detail as time goes on. This will be an important idea when discussing the extrapolation of functions into images through an impression from an expression, which relates the information in the array over time to the perceiver.

The wavelength of the light we are discussing is the initial radius of the circle and the maximum height of the cone, whose direction is toward the subjective perceiver. The transition of that single wavelength into the height of a cone occurs over the course of a revolution of a single circle. The parameters of the velocity of its travel, or the travel of any substance, are frequency and wavelength.

$$\text{We state that : } v = \lambda f, \text{ where v is velocity, } \lambda = r \text{ is wavelength, and } 1/\text{time} = f = \text{frequency.} \tag{155}$$

$$\text{Time} = 360\left(\theta_{\text{degrees}}\right) = 2\pi\theta \tag{156}$$

The velocity being discussed is the first derivative of the distance, which is the height of the cone, *η*. A tiny piece of the ambient array would contain within it information regarding information of the surface off of which the light flowing through the array is reflecting. H contains information about the time and initial distance of a wavelength of light. Where *η* is a given height of a cone, and *θ* the amount of accumulated time of during a transition, r**θ*, which is the difference of the change in circumference between two circles that correlates to the height in the third dimension, the radius of the base of the cone changes in a pythagorean relationship to r and *η*.

In the model of perceptual space - time that I am proposing, the parameters involved can always be reduced to a single expression of a function of time, “it is not meaningful to ask merely how strongly a given unit responds to a given stimulus; the more relevant variable is the temporal pattern of the

response” (BRP 244). Is it possible that the firing of the neurons relates strongly to time, because the shape of the stimulus has an invariant correlate geometrically through time?

Merleau Ponty has said of time, "there is one single time which is self-confirmatory, which can bring nothing into existence unless it has already laid that thing's foundations as present and eventual past, and which establishes itself as a stroke" (PoP 421). The time that is self confirmatory is the time at which the height of the cone has gone up to 2 π and come back down over the course of 4 π radians. In time measured in seconds, this would be one minute in S.I. units, but .

Time is the passing of all real moments into each other and all imaginary moments into the real. This ensures the existence of geometry. In this way, we say that being is through embodiment, but meaning of being is through time, after the body decays. There is the present moment, and when we perceive the world, we are not interpreting our experience based on the passed time, but change of time equal to the total difference in past and present time.

However, by a moment, do we not mean a change in time? This is to say that time has positive and negative solutions within a system of geometric correlations. The experiential moment grows to include the past and present, because time has positive and negative solutions within a given sample of the ambient optic array. This is why going into the mind can extend the experience of time while at the same time experiencing vision. This is because time is based in the spatio-temporal continuity of objects, and mind is capable of the pure reception or inception of persona.

Information of variable contour is transferred to the perceiver by the flux of information in ambient light through each point in the optic array, represented by item number four. The rate of this variance is analogous to velocity in a rotational system, like the structuring of light through space - time. This is what is meant by information in the light. Objects can travel through space-time in a continuous way.

Helmholtz proposes that phenomena regarding the visual system can be described by the use of analogy when things begin to look paradoxical. He takes into consideration the psychic faculties and suggests that the processing of the environment and its perceptual phenomena may occur through an unconscious working of analogy in the mind. I find this to be interesting and agreeable. It provides a humanist account through the recognition of biological factors regarding perceptual systems.

Animals on Earth have evolved in a general perception of time in the environment to be cyclic. The day and night, the rhythm of sleep, the change of the seasons, and the cycles of heavenly bodies like the moon all play a role in the environment of evolving animals on Earth. Some more than others, but for humans, most certainly.

Gibson offers an interesting interpretation to the problem of depth perception. Depth perception is at the heart of what we are discussing. The height of the cone, in a more ecological context, is directed toward the perceiver and contains contoured information within it based on the wavelength of light and time ellapsed during transition. This contoured information exists in every point of the array, and ecological contour is based on the pickup of each wavelength in its relation to the others during a sampling of the array.

Gibson says that, "the problem of depth perception is insoluable, because the problem is false" (BRP 166). He also suggests that we are mistaken in thinking that the, "third dimension of the cartesian coordinate system is a phenomenal fact of perception" (BRP 166). Our coordinate system for describing a tiny piece of interactions going on in the ambient array is based, not on a third dimension of cartesian coordinates, but of a single transition of substance through time. It should be noted that at the event of perception, the information of contour in the layout of the world is delivered to the receptors at a length that has only one dimension at the time of reception. The combined effect of, "points of observation in the medium" (BRP 167), as Gibson might put it, transmits the layout of the world to the perceiver by a mesh of interwoven specifiers.

The perceptual space relies on a conscious experience. Math and the body of sciences can be useful in modeling the elements involved in the deliverance of subjective experience if enough relevant contextual information is given to the model. Right now, machines manipulate signals, but do not have the complexity that human experience has, partly because their system does not have the evolutionary resources developed in an environment over time when constantly responding to its inputs.

The facts let me see contour, while also recognizing that contour from a single image could be illusory. We take data available in light, and construct an image from that data of an object, “though such flip - flopping seldom occurs when we are looking at real cats, it sometimes happens with specially constructed figures viewed under restricted conditions” (BRP 278). If we take the information in light and structure to be a fact, I would say that flip - flopping also occurs under the most general conditions and correlates of known facts to perspectival emanations, which specify qualities of a perception. Depth gives us such determined information, guided by objects that deliver layout to the percept, that flip - flopping rarely occurs. This is what defines an object for visual perception is its stability.

V. The Wavelength with Constant Value

$$v = \lambda f = r / \tau = r\ (1 / (\theta / (2\pi))) = \frac{2\pi r}{\theta} = (1 / (1 / (2\pi)))\ D\left[\frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi}, \theta\right] = \frac{4\pi r^2 - 2 r^2 \theta}{2\sqrt{4\pi r^2 \theta - r^2 \theta^2}} \tag{157}$$

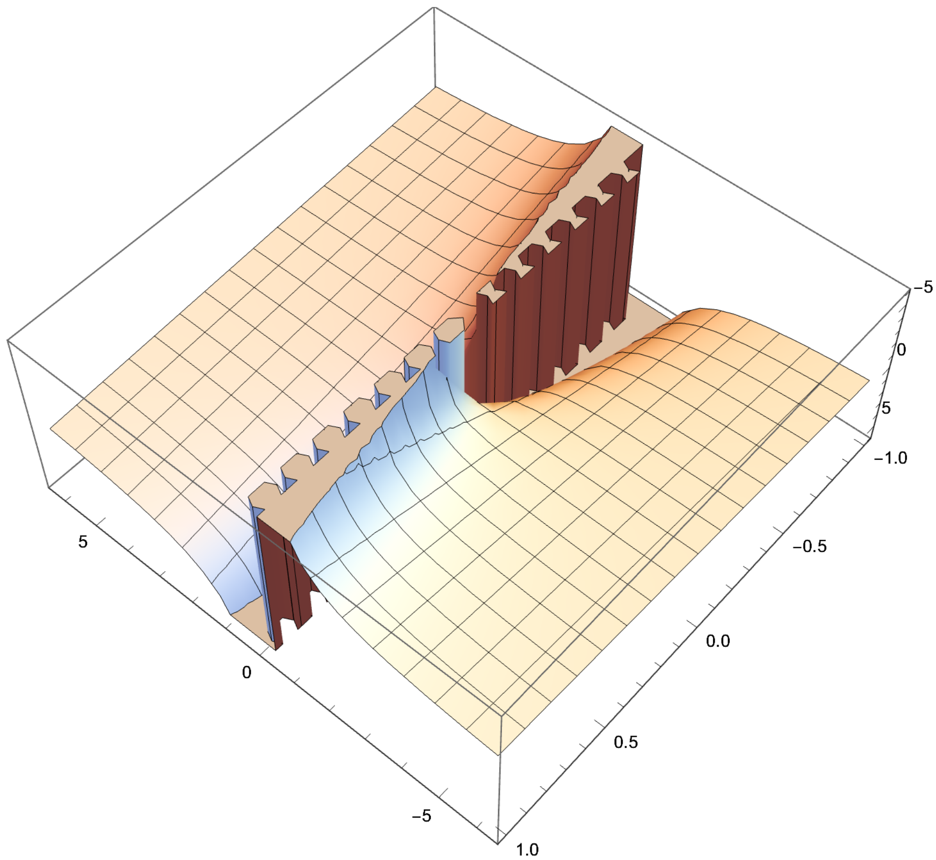
$$2\pi r - 2\pi r_1 = \theta r \tag{158}$$

$$\frac{(2\pi r - 2\pi r_1)}{\theta} = r \tag{159}$$

$$\frac{2\pi r}{\theta} = \frac{2\pi r_1}{\theta} + r \tag{160}$$

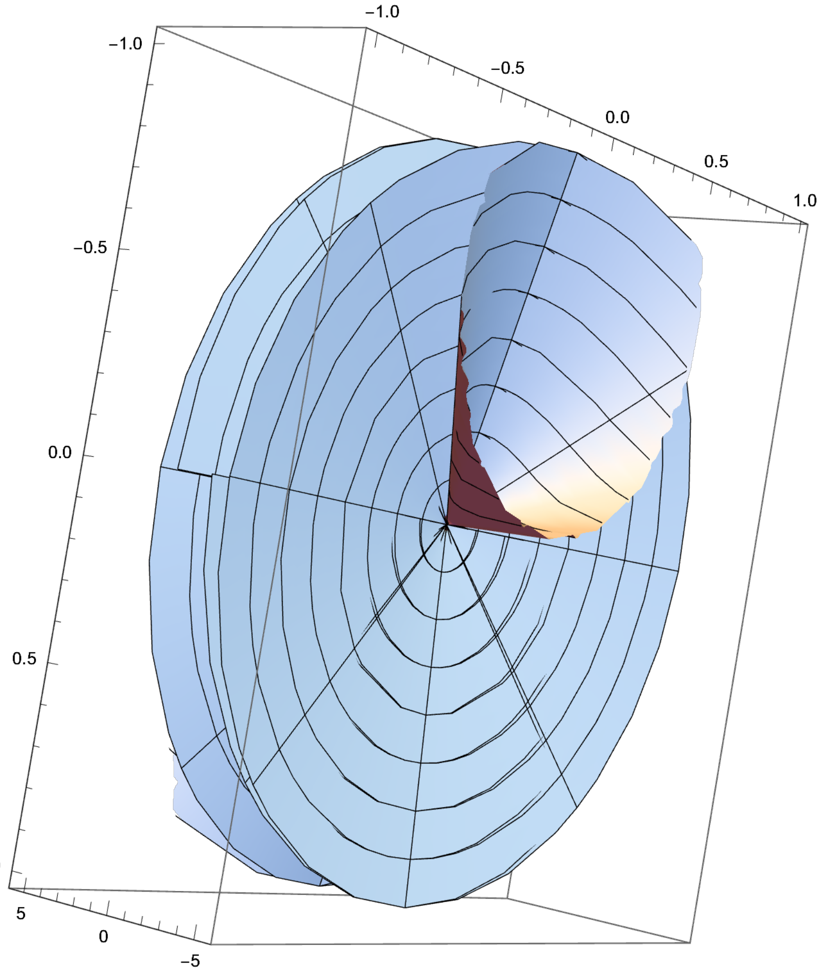
We will try to build up as many functions as possible without resorting to designating something to have a velocity of light or non - light. It is simply a velocity for the time being. This way, we will have access to a realm of general functions of correlated variables.

```
Plot3D[2 π r/θ, {r, -1, 1}, {θ, -2 π, 2 π}]
```



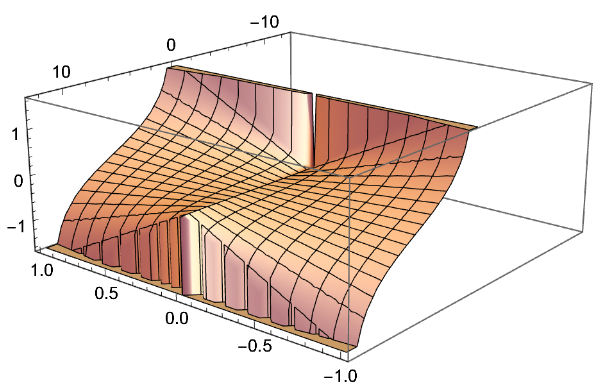
Now we can visually see how velocities would be superpositional. They can fit right on top of each other in this lego - like system while continuing along the same contour.

```
RevolutionPlot3D[2 π r / θ, {r, -1, 1}, {θ, -2 π, 2 π}]
```

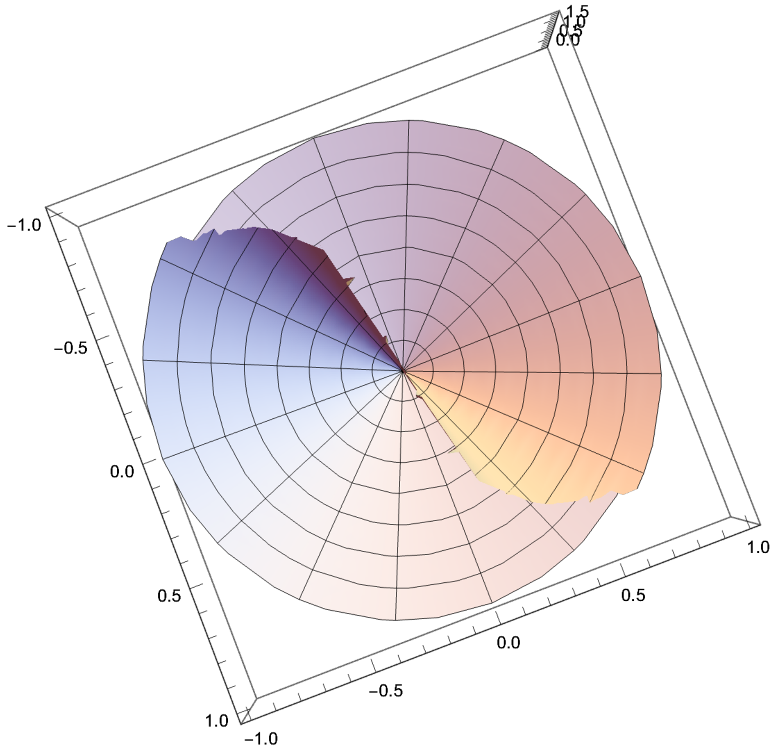


$$\text{Velocity when r is constant} = \frac{4\pi r^2 - 2 r^2 \theta}{2\sqrt{4\pi r^2 \theta - r^2 \theta^2}} \tag{161}$$

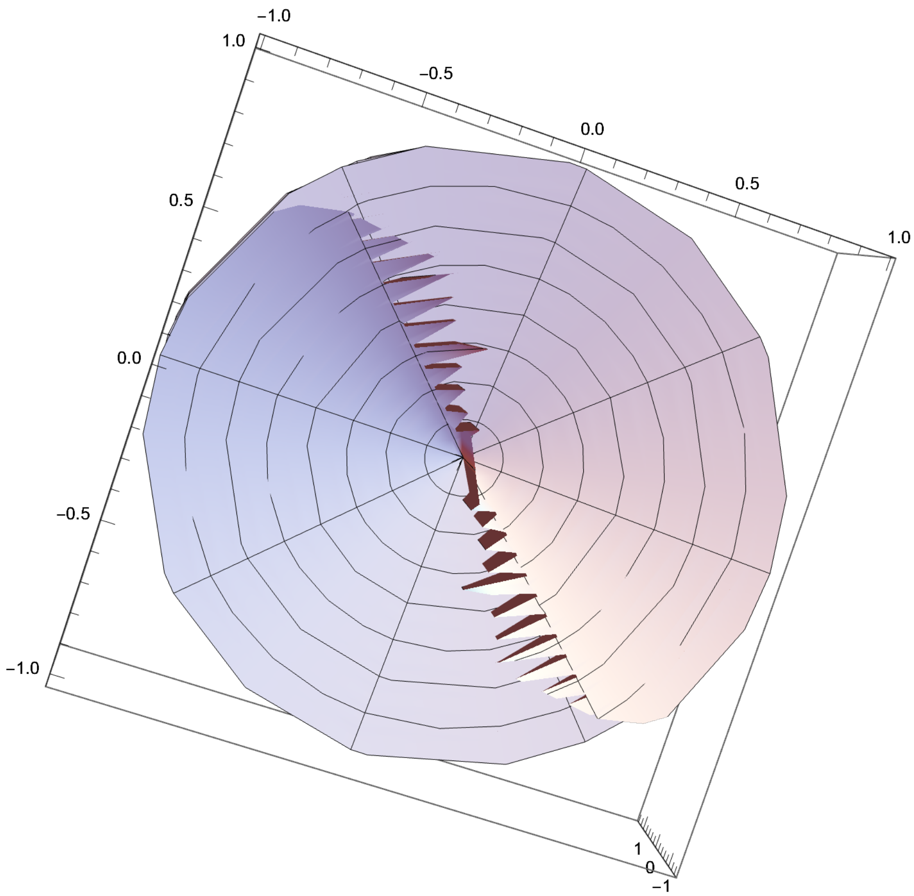
```
Plot3D[(4 π r^2 - 2 r^2 θ) / (2 Sqrt[4 π r^2 θ - r^2 θ^2]), {r, -1, 1}, {θ, -4 π, 4 π}]
```



```
RevolutionPlot3D[(4 π r^2 - 2 r^2 θ)/(2 Sqrt[4 π r^2 θ - r^2 θ^2]), {r, -1, 1}, {θ, -2 π, 2 π}]
```



$$\text{RevolutionPlot3D}\left[\frac{4\pi r^2 - 2 r^2 \theta}{2\sqrt{4\pi r^2 \theta - r^2 \theta^2}}, \{r, -1, 1\}, \{\theta, -4\pi, 4\pi\}\right]$$



We also have access to the equation, $\frac{4\pi r^2 - 2 r^2 \theta}{2\sqrt{4\pi r^2 \theta - r^2 \theta^2}} == r / (\theta / (2\pi))$, which winds up having the r variable cancel out, and delivers three exact solutions for theta. (162)

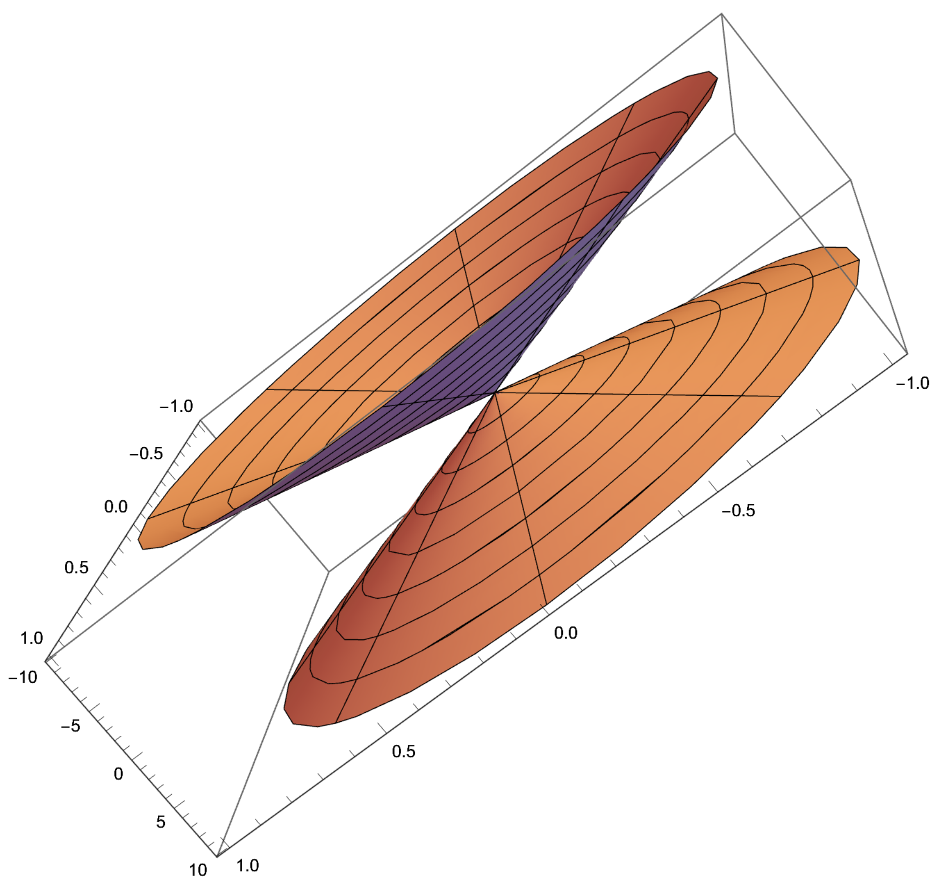
$$\text{Solve}\left[\frac{4\pi r^2 - 2 r^2 \theta}{2\sqrt{4\pi r^2 \theta - r^2 \theta^2}} == \frac{2\pi r}{\theta}, \theta\right]$$

$$\left\{\left\{\theta \to \frac{2}{3}\left(2\pi - \frac{2\pi}{\left(17+3\sqrt{33}\right)^{1/3}} + \left(17+3\sqrt{33}\right)^{1/3}\pi\right)\right\},\right.$$
$$\left\{\theta \to \frac{4\pi}{3} + \frac{2\left(1+i\sqrt{3}\right)\pi}{3\left(17+3\sqrt{33}\right)^{1/3}} - \frac{1}{3}\left(1-i\sqrt{3}\right)\left(17+3\sqrt{33}\right)^{1/3}\pi\right\}, \quad (163)$$
$$\left.\left\{\theta \to \frac{4\pi}{3} + \frac{2\left(1-i\sqrt{3}\right)\pi}{3\left(17+3\sqrt{33}\right)^{1/3}} - \frac{1}{3}\left(1+i\sqrt{3}\right)\left(17+3\sqrt{33}\right)^{1/3}\pi\right\}\right\}$$

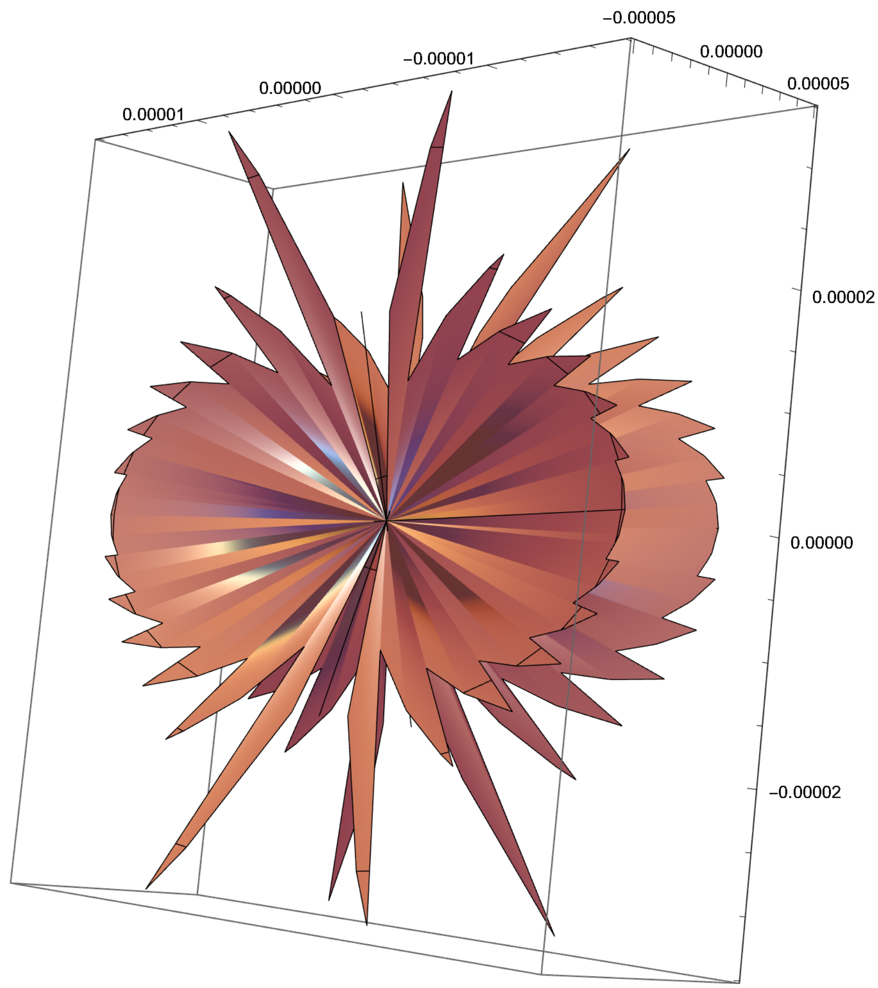
With these exact solutions for theta, we are afforded the opportunity to look at a change in circumferences by multiplying the results by the initial radius. We remember from the initial postulates that the change in circumference of a sample of the ambient array was equal to the initial radius of an angle.

```
RevolutionPlot3D[
```

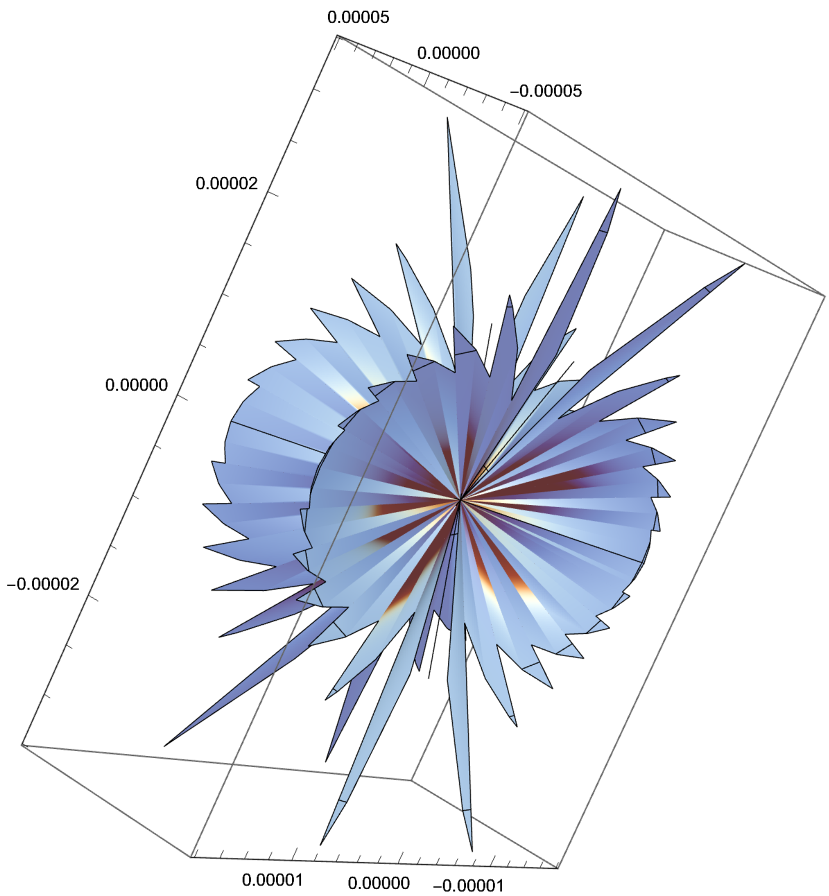
$$r\left(\frac{2}{3}\left(2\pi-\frac{2\pi}{\left(17+3\sqrt{33}\right)^{1/3}}+\left(17+3\sqrt{33}\right)^{1/3}\pi\right)\right),\ \{r,-1,1\},\ \{\theta,-2\pi,2\pi\}]$$



$$\texttt{RevolutionPlot3D}\left[r\left(\frac{4\,\pi}{3}+\frac{2\left(1+\mathbb{i}\sqrt{3}\right)\pi}{3\left(17+3\sqrt{33}\right)^{1/3}}-\frac{1}{3}\left(1-\mathbb{i}\sqrt{3}\right)\left(17+3\sqrt{33}\right)^{1/3}\pi\right),\ \{r,-1,1\}\right]$$



$$\text{RevolutionPlot3D}\left[r\left(\frac{4\pi}{3}+\frac{2\left(1-i\sqrt{3}\right)\pi}{3\left(17+3\sqrt{33}\right)^{1/3}}-\frac{1}{3}\left(1+i\sqrt{3}\right)\left(17+3\sqrt{33}\right)^{1/3}\pi\right),\{r,-1,1\}\right]$$



We will note that an arc length is equal to r*θ. The change in perceived circumference of the circle is also equal to r*θ. Thus, we will be able to see what the arc length is, because it represents the change in circumference of two circles. In this case, as the circle, viewed from head on, recedes from the perceiver into the distance, it gets smaller. This is a change in amount of surface area taken up on the retinal image, but also a way of visualizing how the imaginary solutions for the time element of waves traveling in space affords a perception of layout.

Light travels through space, but within its travel is the information that the angular element of the system, which is akin to time, conveys specifically about the location of contour in perceptual space through a geometric correlation. This correlation occurs through the complex plane and has the capability of mapping out contour in the visual perception directly by analogy of larger ecology to individual play of ambient light off of a contour. We will try to show this symbolically as well as directly.

When combined, the three imaginary solutions form a cone, but seperately, they exist primarily in the complex plane. It requires all three solutions to deliver information of depth to the perceiver through light in terms of the real. In Gibson' s theory, depth is intimately connected with contour. Contour is delivered by the pickup of the invariant, r, in the ambient array, changing context in a

different way from point to point. Thus, understanding of two truths in the real world like information given to the perceiver of an object by an edge, for instance, is enabled. At the moment of perception, we have a total amount of time equal to 0, but since time continues, and time has passed, there is a total amount of changed time from past to present, which is equal to the absolute value of the negative solutions for time plus the positive solutions. We will not use this interpretation, because it is an in depth introspection into the experience of consciousness, which would require understanding of cognitive systems or possibly spiritual experience, and we are only looking at the phenomenon of the structure of perception.

Mach began by verifying a belief in the space - sense, an area of parameterized space relating the sense of an individual to the stimulus in the world. The space - sense provides a workspace for the individual senses like sense of sight and touch to enable a perceptual experience.“ The perception of Depth depends on extra - occular experiences” (BRP 118) is an idea that makes a great deal of sense to me, because when we experience or perceive truth, we use multiple faculties to make sense of a phenomenon.

The ambient optic array, which is the entire collection of individual points of light, binds single points in the array through the complex plane, and affords the perception of objects, because objects disrupt the array in the real, but the structure of light assures that the imaginary elements of objects correspond to only one real object. Or, if there is a real object, then the imaginary elements of perceiving that object specify a single event of perceiving that object.

The imaginary solutions to perceiving objects through time could change only if the qualia of the layout of objects changed, or the disruption in the array changed to remain allowing the overall combinations of modulars in the single modular of perception through consciousness. We still ask if personality of the perception changed the meaning of the object to layout of the world within the unified modular of perception, would the structuring of the array change or harmonize with the substance? Sampling allows us to determine if the layout is different from structuring, because the array is the environmental context of the perception, and shares a similar structure to each point within it. This is a manner of perception.

The mapping out of contour from information in light shares a similar structure to the measurement of size. I don’t think it makes sense to begin by postulating an object, only postulating that there is the pickup of information that there is contour in the environment. The perception of this contour like it is an actual object, however, is ephemeral and somewhat illusory. All we can have access to for studying vision scientifically or phenomenologically is the percept of contour in a projection to the mind, “My knowledge of the plane crash derives from my knowledge of the newspapers because I did not see the plane crash” (BRP 273). However, to find out how perception operates, we must recognize the conditions necessary for information to be transferred from the environment that it is at least partially a complex environment.

The initial radius changes context, but can it be said to actually change? The wavelength, r, could be said to be changing if we consider that $\Delta r = r - r_1$. Although it is invariant in the context of always being the slant of the cone, it changes when understood to be the base of the cone. It also changes

meaning when we consider the structure in an ecological context. The height of the cone starts at the place where there is an infinitely perceived radius (i.e. no perception, all white eye-caps, or unseen, because it is so far away on the horizon), and goes toward the locus of perception, which is the perceiver. It is reasonable, to think that a wavelength could change during the course of traveling a single wavelength through cominative substances like light or water. When the circle is infinitely far away, it has a perceived radius of 0, and this is the same point at which there is nothing perceived, because channels of sensation eventually disappear after extending in time. Layout and contour come into focus best when during the awareness of time extends into the very small amounts of angular passage per sample.

A relativistic mapping of η looks somewhat different at larger values, but at normal values, it looks exactly the same.

The radius is said to be invariant through the transition from being the initial radius of a circle to being the height of a cone. We set up the equation that says that an arc length of the original circle is equal to a diference in circumferences from transition to a cone, where the Pythagorean Theorem tells us the equation for height in terms of only r and θ, and angular element akin to time. It is always either the original radius of the circle, the slant of the cone, or the height of the cone. The initial radius is constant, but changes context in the system through transition.

VI. An Inherency of Relativity to Invariance

The radius is said to be invariant through the transition from being the initial radius of a circle to being the height of a cone. We set up the equation that says that an arc length of the original circle is equal to a diference in circumferences from transition to a cone, where the Pythagorean Theorem tells us the equation for height in terms of only r and θ, and angular element akin to time. It is always either the original radius of the circle, the slant of the cone, or the height of the cone. The initial radius is constant, but changes context in the system through transition.

What if the system we are talking about is traveling at relativistic speeds? Not the substance within the system, but the actual system, and all of its parameters. They could all be subject to relativity at the same time or during the same motion.

$$\eta \to \frac{\sqrt{4 \pi r^2 \theta - r^2 \theta^2}}{2 \pi} \tag{164}$$

$$r' = r \sqrt{1 - ((v)^2 / c^2)} \tag{165}$$

$$t' = (\theta / (2 \pi)) \Big/ \sqrt{1 - ((v)^2 / c^2)} \tag{166}$$

$$t' = \theta' / 2 \pi \tag{167}$$

$$\theta' = \theta \Big/ \sqrt{1-((v)^2/c^2)} \tag{168}$$

$$r' * \theta' = \left(\theta \Big/ \sqrt{1-((v)^2/c^2)}\right)\left(r\sqrt{1-((v)^2/c^2)}\right) \tag{169}$$

$$\left(\theta \Big/ \sqrt{1-((v)^2/c^2)}\right)\left(r\sqrt{1-((v)^2/c^2)}\right) = r\,\theta \tag{170}$$

$$r' * \theta' = r\,\theta = 2\,\pi\,r - 2\,\pi\,r_1 = 2\,\pi\,r - 2\,\pi\sqrt{r\,\hat{}\,2 - \eta\,\hat{}\,2} \tag{171}$$

$$\text{Solve}\left[r\,\theta == 2\,\pi\,r - 2\,\pi\sqrt{r\,\hat{}\,2 - \eta\,\hat{}\,2},\ \eta\right] \tag{172}$$

$$\left\{\left\{\eta \to -\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}\right\},\ \left\{\eta \to \frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}\right\}\right\}$$

We make the substitution for the prime system.

w := r', ρ := θ'

$$\textbf{Solve}\left[w\,\rho == 2\,\pi\,r - 2\,\pi\sqrt{r\,\hat{}\,2 - \eta\,\hat{}\,2},\ \eta\right]$$

$$\left\{\left\{\eta \to -\frac{\sqrt{w}\ \sqrt{\rho}\ \sqrt{4\,\pi\,r - w\,\rho}}{2\,\pi}\right\},\ \left\{\eta \to \frac{\sqrt{w}\ \sqrt{\rho}\ \sqrt{4\,\pi\,r - w\,\rho}}{2\,\pi}\right\}\right\}$$

Then, once we have solved for η in terms of the prime system, we can resubsitute in for the initial expressions of r' and θ'.

$$\frac{1}{2\,\pi}\sqrt{r\sqrt{1-((v)^2/c^2)}}\ \sqrt{\theta \Big/ \sqrt{1-((v)^2/c^2)}}$$

$$\sqrt{4\,\pi\,r - \left(r\left(\sqrt{1-((v)^2/c^2)}\right)\right)\left(\theta \Big/ \sqrt{1-((v)^2/c^2)}\right)}$$

$$\textbf{Solve}\left[\frac{\sqrt{r\sqrt{1-\frac{v^2}{c^2}}}\ \sqrt{\frac{\theta}{\sqrt{1-\frac{v^2}{c^2}}}}\ \sqrt{4\,\pi\,r - r\,\theta}}{2\,\pi} == \frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi},\ r\right]$$

{{}}

$$\textbf{Solve}\left[\frac{\sqrt{r\sqrt{1-\frac{(r/(\theta/(2\,\pi)))^2}{c^2}}}\ \sqrt{\frac{\theta}{\sqrt{1-\frac{(r/(\theta/(2\,\pi)))^2}{c^2}}}}\ \sqrt{4\,\pi\,r - r\,\theta}}{2\,\pi} == \frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi},\ v\right]$$

{{}}

$$\text{Solve}\left[\frac{\sqrt{r\sqrt{1-\frac{v^2}{c^2}}}\ \sqrt{\frac{\theta}{\sqrt{1-\frac{v^2}{c^2}}}}\ \sqrt{4\pi r - r\theta}}{2\pi} == \frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}, \theta\right]$$

{{}}

$$\text{Solve}\left[\frac{\sqrt{r\sqrt{1-\frac{(r/(\theta/(2\pi)))^2}{c^2}}}\ \sqrt{\frac{\theta}{\sqrt{1-\frac{(r/(\theta/(2\pi)))^2}{c^2}}}}\ \sqrt{4\pi r - r\theta}}{2\pi} == \frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}, r\right]$$

{{}}

The velocity at the time at which η = r can be found according to theta and the speed of light. We would then substitute expressions for theta in terms of beta in order to visual the equation spherically. This is how our model relates directly to perception. We say that the light (or any substance traveling through the height of the cone) can only be specified by subjective perception or by objectively defining the initial wavelength of the system from the start. The wavelength of light, λ = r, is observed when the cone has completed one cycle of the system in terms of the standard unit of measurement of time. This happens at the distinct situation of η = r, which specifies an event of perception or observation.

$$\text{Solve}\left[\frac{\sqrt{r\sqrt{1-\frac{(v)^2}{c^2}}}\ \sqrt{\frac{\theta}{\sqrt{1-\frac{(v)^2}{c^2}}}}\ \sqrt{4\pi r - r\theta}}{2\pi} == r, v\right]$$

```

From this, we can see how, from our system, we have specified that time is a continuum. It continues on the x axis out infinitely. Our time variable, θ, is in essence, an axis of its own accord.

To see in depth what this observation signifies, we solve for velocity and show expressions for this velocity in terms of theta and beta from the initial conditions of the system. There is a multiplicity of substitutions that we can make. In the end, they will all turn out to have an expression that is envisioned by one of seven different graphical objects. We will give a brief overview of the forms that we find in which substance can travel. We will label them, although each expression for the graphical object will not be given, because there are so many that it would take pages to fill.

We remember from earlier that we can place theta in terms of beta. Each placement of the substitution in a different position of the equation yields another way of perceiving/observing light traveling through space - time. In addition to this, the combination of the functions can occur in the same graphcial representation. We will not go into the multifaceted ways of combining these graphs, but specifically outline a few of the more basic, notable forms.

$$\left\{\left\{\theta \to 2\left(\pi - \sqrt{\pi^2 - \pi^2 \,\mathrm{Sin}[\beta]^2}\right)\right\}, \left\{\theta \to 2\left(\pi + \sqrt{\pi^2 - \pi^2 \,\mathrm{Sin}[\beta]^2}\right)\right\}\right\}$$

, When we make patterns of substitutions for theta in terms of beta within the equation, we see that there are discontinuous methods for graphing the information contained in the velocity of light or substance to produce a visualization. In other words, the same equation with different orders of substitutions for theta in terms of beta give us different impressions of how we observe the spacetime functioning. That is part of a relativistic equation for traveling through the height of a cone at the point of perception, the event of perception, when r = η. In other words, sometimes we see are able to visualize a form of the equation, and sometimes we are not. Gibson has said that, "The necessary condition for pattern vision is an *inhomogeneity* of the set of hypothetical rays" (The Visual World, 64). These visualiza-

tions of velocities are vectors, and hypothetically, rays. Gibson refers to types of order, the first being light or dark. Light is a natural type of stimulation, and thus it is a very useful tool for understanding the natural inhomogeneity going on during the event of perception. Perception is given to us in a multi-faceted series of ways of visualizing light. It should be noted that while light is the only substance that reaches the eye, the substance of light travels in a similar way to other forms of energy like mass. These different ways of visualizing light often pop up as concepts in modern physics. For the purposes of this paper, we are more interested in their correlations to the, "*explanation* of experience" (The Visual World, 8), because, "there are laws relating perception to physical stimulation as well as laws relating it to physiological processes" (The Visual World, 8).

With the above and continuing mathematical count of the

Light travels carrying information only upon reaching the threshold of the event of perception.

```

The form of this wave is useful to modeling a contoured surface mathematically, because we can

see a continuous curve that does not have to build the contour out of smaller triangles, but is very smooth and continuously curved.

Light/substance travels like a manifold (sheets of paper layered upon one another).

VII. The Flow of Light through an Ambient Array (The Array Is within Each Point of the Ecologically Visual Field)

There are non - relatavisitic solutions to the height of the cone that include the Lorenz Transformations. This is because in the normal course of primal sketching, a visual system detects the edge of a circle and relates it to the distance away from which the observer is. The size of the primal sketching is dependent upon the measurement made by the eye relativistically, however, when determining a change between sizes, the Lorenz factor will cancel. For this section, the visualizations are very complex if we want to see all the different possible nested equations. We will refer the reader to the fourth

addendum to this paper for further visualizations.

We can formulate the non - relativistic equation for the height of the cone in terms of the speed of light of non - relativistic time :

$$\frac{\sqrt{r\sqrt{1-\frac{v^2}{c^2}}}\sqrt{\frac{\theta}{\sqrt{1-\frac{v^2}{c^2}}}}\sqrt{4\pi r-r\theta}}{2\pi}==c\,(\theta/(2\pi)) \tag{173}$$

This will give us introspection into the meaning of relativity' s relation of the consciously perceptual system to the visual system and if the visual system has evolved with a response to relativistic principles. We will be able to visualize the ambient optic array and the inhomogeneities within it.

$$\mathbf{Solve}\left[\frac{\sqrt{r\sqrt{1-\frac{v^2}{c^2}}}\sqrt{\frac{\theta}{\sqrt{1-\frac{v^2}{c^2}}}}\sqrt{4\pi r-r\theta}}{2\pi}==c\,(\theta/(2\pi)),\ v\right]$$

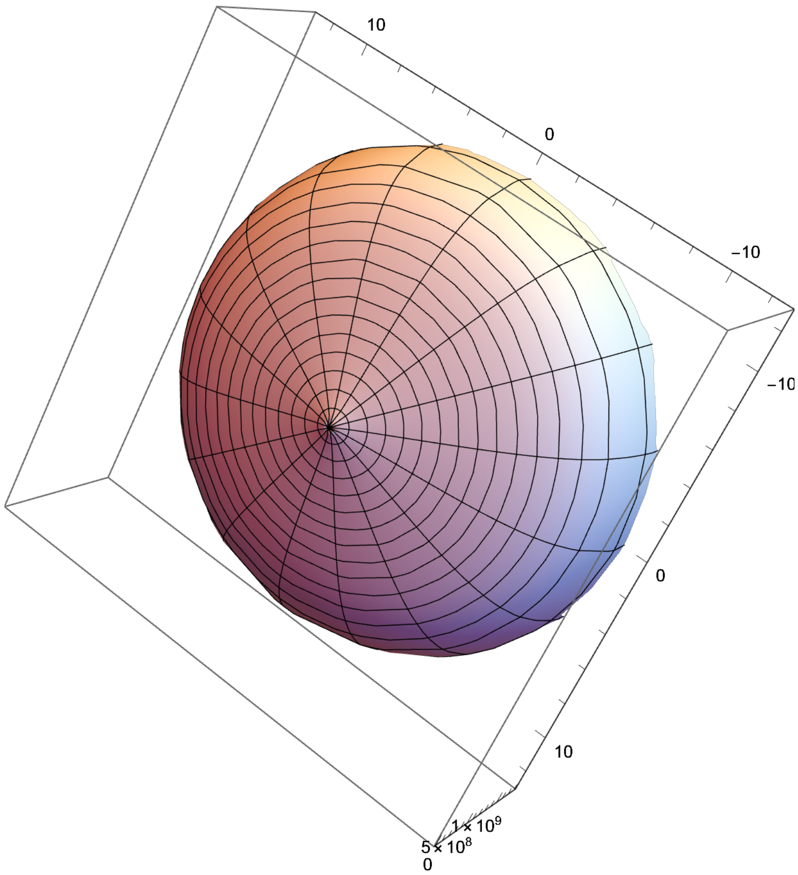
{}

$$\mathbf{Solve}\left[\frac{\sqrt{r\sqrt{1-\frac{v^2}{c^2}}}\sqrt{\frac{\theta}{\sqrt{1-\frac{v^2}{c^2}}}}\sqrt{4\pi r-r\theta}}{2\pi}==c\,(\theta/(2\pi)),\ r\right]$$

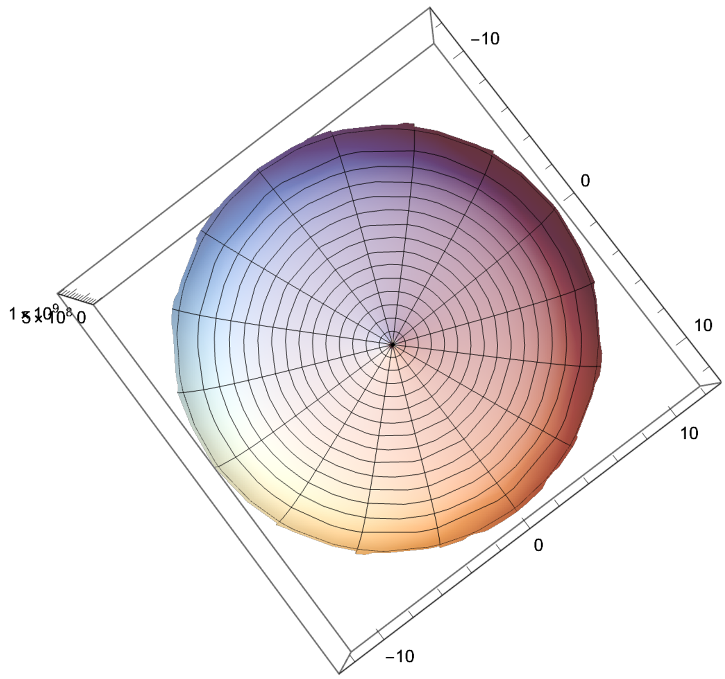
$$\left\{\left\{r\to-\frac{c\sqrt{\theta}}{\sqrt{4\pi-\theta}}\right\},\left\{r\to\frac{c\sqrt{\theta}}{\sqrt{4\pi-\theta}}\right\}\right\}$$

```
RevolutionPlot3D[c Sqrt[θ]/Sqrt[4 π - θ], {θ, -4 π, 4 π}]
```

$$\text{RevolutionPlot3D}\left[\frac{c\sqrt{\theta}}{\sqrt{4\pi-\theta}}, \{\theta, -4\pi, 4\pi\}\right]$$



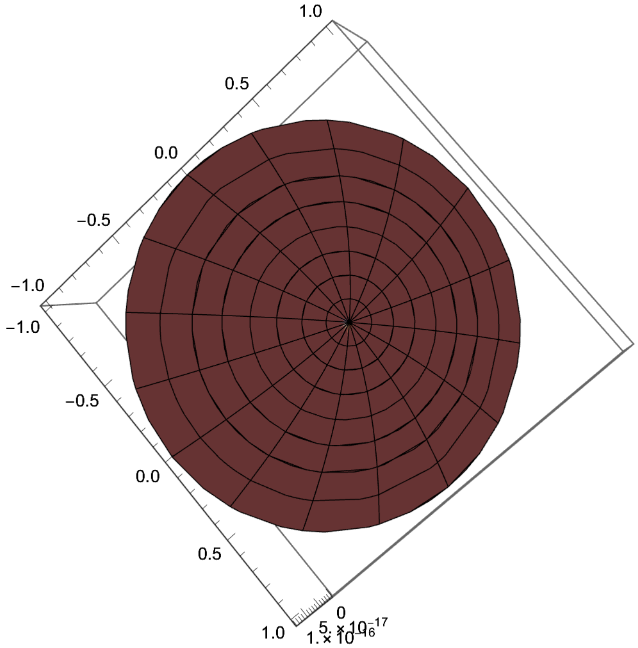
This is an example of inhomogeneity within the ambient optic array. From one side of the expression for radius in terms of the speed of light and time, we see that there is a solid surface, but on the other side, the middle of the bowl is overcome by white saturation. Granted, these are not the proper form of the equation, because they are non-relativisitc, but we will soon get a look at some of the relativistic interpretations of information within the light.



$$\text{Solve}\left[\frac{\sqrt{r\sqrt{1-\frac{v^2}{c^2}}}\ \sqrt{\frac{\theta}{\sqrt{1-\frac{v^2}{c^2}}}}\ \sqrt{4\pi r - r\theta}}{2\pi} == c\ (\theta/(2\pi)),\ \theta\right]$$

$$\left\{\{\theta \to 0\},\ \left\{\theta \to \frac{4\pi r^2}{c^2+r^2}\right\}\right\}$$

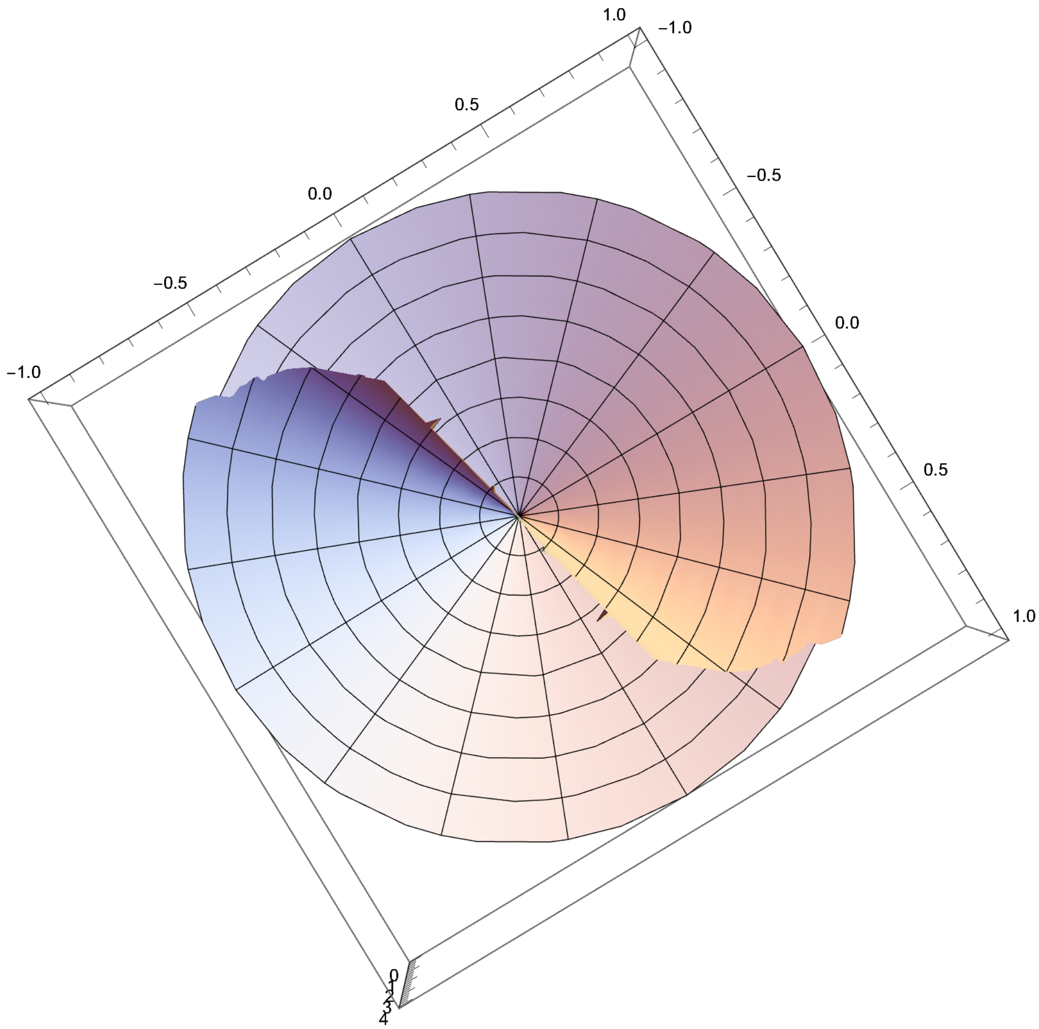
$$\text{RevolutionPlot3D}\left[\frac{4\,\pi\,r^2}{c^2+r^2},\ \{r, -1, 1\}\right]$$



$$\text{Solve}\left[\frac{\sqrt{r\,\sqrt{1-\frac{v^2}{c^2}}}\ \sqrt{\frac{\theta}{\sqrt{1-\frac{v^2}{c^2}}}}\ \sqrt{4\,\pi\,r - r\,\theta}}{2\,\pi} == c\,(\theta\,/\,(2\,\pi)),\ c\right]$$

$$\left\{\left\{c \to -\frac{\sqrt{4\,\pi\,r^2 - r^2\,\theta}}{\sqrt{\theta}}\right\},\ \left\{c \to \frac{\sqrt{4\,\pi\,r^2 - r^2\,\theta}}{\sqrt{\theta}}\right\}\right\}$$

$$\text{RevolutionPlot3D}\left[\frac{\sqrt{4\,\pi\,r^2 - r^2\,\theta}}{\sqrt{\theta}},\ \{r, -1, 1\},\ \{\theta, -2\,\pi, 2\,\pi\}\right]$$



We can formulate the relativistic equation for the height of the cone in terms of the speed of light of relativistic time :

$$\frac{\sqrt{r\,\sqrt{1-\frac{v^2}{c^2}}}\ \sqrt{\frac{\theta}{\sqrt{1-\frac{v^2}{c^2}}}}\ \sqrt{4\,\pi\,r - r\,\theta}}{2\,\pi}\ \sqrt{1-\frac{v^2}{c^2}} == c\left((\theta\,/\,(2\,\pi))\Big/\sqrt{1-\frac{v^2}{c^2}}\right) \tag{174}$$

$$\text{Solve}\left[\frac{\sqrt{r\,\sqrt{1-\frac{v^2}{c^2}}}\ \sqrt{\frac{\theta}{\sqrt{1-\frac{v^2}{c^2}}}}\ \sqrt{4\,\pi\,r - r\,\theta}}{2\,\pi}\ \sqrt{1-\frac{v^2}{c^2}} == c\left((\theta\,/\,(2\,\pi))\Big/\sqrt{1-\frac{v^2}{c^2}}\right),\ \theta\right]$$

$$\left\{\{\theta \to 0\},\ \left\{\theta \to \frac{4\,\pi\,\left(c^4\,r^2 - 2\,c^2\,r^2\,v^2 + r^2\,v^4\right)}{c^6 + c^4\,r^2 - 2\,c^2\,r^2\,v^2 + r^2\,v^4}\right\}\right\}$$

Time is visualized from contour to be a gradient of texture. We can also visualize the layout when we know that light travels at a fairly constant speed through substances like air.However, when we consider it to be a variable, which it truly is, we can see how there is information contained within time's relation to the velocity of a perceiver, the speed of light being perceived, and the initial radius of the circle transforming into a cone, which is the wavelength of light.

$$\text{ContourPlot3D}\left[\frac{4\pi\left(c^4 r^2 - 2 c^2 r^2 v^2 + r^2 v^4\right)}{c^6 + c^4 r^2 - 2 c^2 r^2 v^2 + r^2 v^4},\right.$$

VIII. Theoretical Relations of Point to Point Pickup of Invariance through the Imaginary Plane

We have discussed the geometry of a cone, and shown that when a substance of any kind travels through the height of the cone, we can solve for its velocity in two different ways. We can take the first derivative of the maximum distance of the height of the cone with respect to time, and understand that the wavelength of light received has an actual initial radius equal to the wavelength of light received by the perceiver. We have also shown that we can solve for a velocity through the height of the cone by application of relativity and the initial principle that η = r at the maximum height of the cone.

We will now show that it's possible to include imaginary solutions to theta during the comination of multiple points in the visual field.

I. Math for Transforming a Circle into a Cone

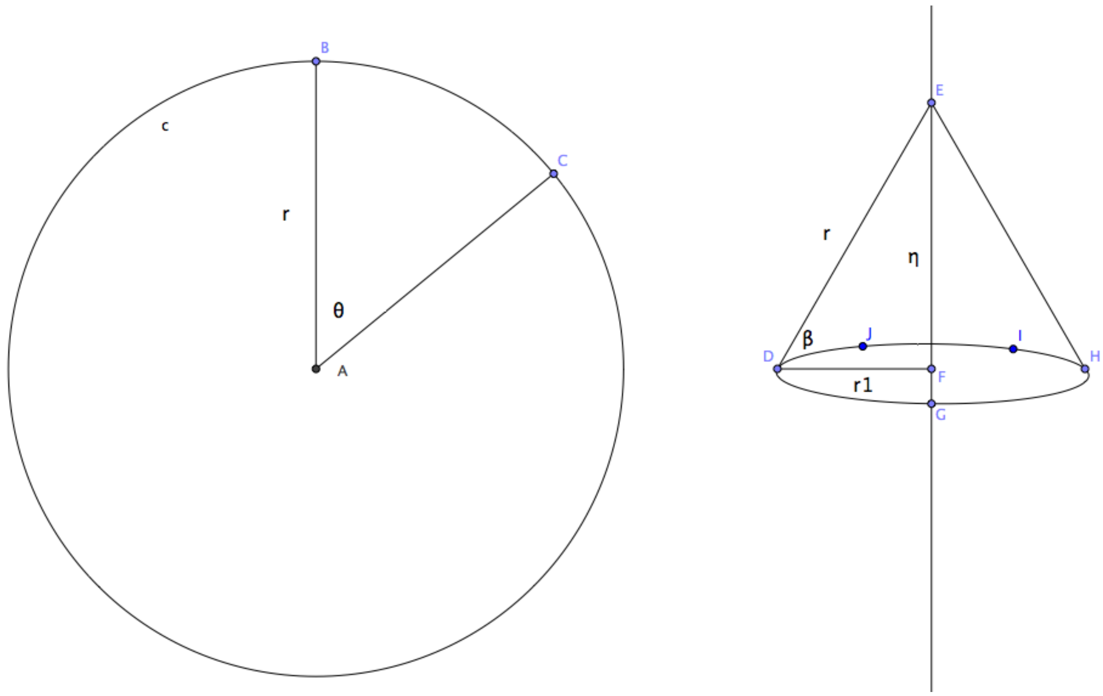

Figure 1

When a sector of a circle is removed, we may "fold up" the resulting shape into a cone. The parameters are related by the following theorem :

Theorem 1 *When a sector of angle θ is removed from a circle of radius r and the resulting shape is folded into a cone, then the base of the cone has radius r_1 given by $r_1 = r - \frac{(r\theta)}{2\pi}$; and height η, given by $\eta = \sqrt{r^2 - r_1^2}$* = r Sin[$\beta$]

Proof. The circumference of the initial circle is 2π r and the wedge removed has an arc length r θ. Therefore, the remaining circumference is of length r $(2\pi - \theta)$, and after the fold, this is the circumference of the base of the cone.

Establishing the circumference of the base of the cone, from the equation, $\theta\,r = 2\pi\,r - 2\pi\,r_1$, we calculate that its radius r_1 is $\frac{2\pi r - r\theta}{2\pi}$, which simplifies to r - $\frac{r\theta}{2\pi}$. Thus, we have proved the first part of the theorem.

To find the height of the cone, η, we apply the Pythagorean theorem to a right triangle formed between the apex of the cone, the center of the base, and a point on the circumference of the base. This gives $\eta = \sqrt{r^2 - r_1^2}$ = r Sin[β], where β is the angle formed by the slant of the cone and the base of the cone. The initial radius is always equal to the slant of the cone, and the height of the cone is always orthogonal to the center of the base of the cone.

This element of the theorem assumes modus ponens from the thought of $\eta = \sqrt{r^2 - r_1^2}$ = r Sin[β], and it assumes addition and commutation.

Lemma 1 The height of the cone can be caluclated in terms of r and θ.

Proof.

$$\theta\,r = 2\pi\,r - 2\pi\,r_1$$

$$\eta = \sqrt{r^2 - r_1^2}$$

$$\theta\,r = 2\pi\,r - 2\pi\sqrt{(r\hat{}2 - \eta\hat{}2)}$$

$$\eta = \frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}$$

Lemma 2 The angle θ can be calculated in terms of r and η.

Proof

$$\text{Solve}\left[\eta == \frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}, \theta\right]$$

$$\left\{\left\{\theta \to \frac{2\pi\left(r^2 - \sqrt{r^4 - r^2\eta^2}\right)}{r^2}\right\}, \left\{\theta \to \frac{2\pi\left(r^2 + \sqrt{r^4 - r^2\eta^2}\right)}{r^2}\right\}\right\}$$

Lemma 3 The initial radius is a function of θ and η.

$$\text{Solve}\left[\frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi} == \eta, r\right]$$

$$\left\{\left\{r \to -\frac{2\pi\eta}{\sqrt{4\pi\theta - \theta^2}}\right\}, \left\{r \to \frac{2\pi\eta}{\sqrt{4\pi\theta - \theta^2}}\right\}\right\}$$

Lemma 4 *The height of the cone can be calculated in terms of only r and* θ, thus β is a function of θ alone.

Proof. Since we have shown that $\theta\, r = 2\pi r - 2\pi r_1$ and $r_1 \to \sqrt{r^2 - \eta^2}$, we can substitute the expression for r_1, calculated from the Pythagorean theorem in terms of the height of the cone and the initial radius of the circle, into the expression for θ r in terms of the change in circumference of the initial circle to the circle, which is the base of the cone. $\theta\, r = 2\pi r - 2\pi \sqrt{(r\wedge 2 - \eta\wedge 2)}$, thus, $\eta = \frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}$ = (r Sin[β]). From $\frac{2\pi\eta}{\sqrt{4\pi\theta-\theta^2}}$= r, we note that r = $\frac{2\pi r\,\text{Sin}[\beta]}{\sqrt{4\pi\theta-\theta^2}}$, so

$\theta = 2\left(\pi \pm \sqrt{\pi^2 - \pi^2\,\text{Sin}[\beta]^2}\right) = \frac{2\pi\left(r^2 + \sqrt{r^4 - r^2\eta^2}\right)}{r^2}$, because $1 = \frac{2\pi\,\text{Sin}[\beta]}{\sqrt{4\pi\theta-\theta^2}}$

Lemma 5 *The height of the cone can be calculated in terms of only r and* θ, thus θ is a function of β alone, and the initial radius can be calculated purely in terms of the angle θ.

$$\beta = \text{ArcSin}\left[\frac{\sqrt{(4\pi - \theta)\,\theta}}{2\pi}\right] = f\,(\theta)$$

$$\text{Sin}[\beta] = \frac{\eta}{r} = \frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{r\,2\pi} = \frac{4\pi r^2\theta - r^2\theta^2}{4\pi^2 r} = \frac{r\,(4\pi - \theta)\,\theta}{4\pi^2}$$

$$\beta \to \text{ArcSin}\left[\frac{4\pi r\theta - r\theta^2}{4\pi^2}\right] = \text{ArcSin}\left[\frac{\sqrt{(4\pi-\theta)\,\theta}}{2\pi}\right]$$

$$\text{Solve}\left[\text{ArcSin}\left[\frac{4\pi r\theta - r\theta^2}{4\pi^2}\right] == \text{ArcSin}\left[\frac{\sqrt{(4\pi-\theta)\,\theta}}{2\pi}\right], r\right]$$

c := (2.99792458 * 10 ^ 8)

η := rate * time = c * τ = height of cone (193)

τ := 6 $\left(\Theta_{\text{degrees}}\right)$ = 6 ((180 / π) Θ), because if theta were in radians to begin with,
we would have to convert that number of radians to degrees. This way,
both our thetas are in radians,
but our result accounts for the constant of the degrees involved in measuring time.

$$\eta \to \frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}$$

v = λ ν = r (1 / (1080 / π) θ) = ((1 / (1080 / π)) D[η, θ]) = 1 / (1080 / π))

$$D\left[\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi},\ \theta\right] \tag{194}$$

The velocity of η is equal to the first derivative of η with respect to time. The constant (1/(1080/π)) is taken out of the equation in order to perform the derivative.

$$(1 / (1080 / \pi))\ D\left[\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi},\ \theta\right]$$

$$\frac{4\,\pi\,r^2 - 2\,r^2\,\theta}{4320\,\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}$$

let ' s just say that velocity is constant

$$(1 / (1080 / \pi))\ D\left[\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}\left(\sqrt{1 - ((v)\,\hat{}\,2 / c\,\hat{}\,2)}\right),\ \theta\right]$$

$$\frac{\sqrt{1 - \frac{v^2}{c^2}}\,\left(4\,\pi\,r^2 - 2\,r^2\,\theta\right)}{4320\,\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}} = c$$

Since we are specifying that the velocity is constant equal to the speed of light.

c := (2.99792458 * 10 ^ 8)

The Wavelength with Changing Value

When the experience is one of white, the perceptual system does not immediately distinguish between combinative or pigmented character to the white. The perceptual system perceives all the combinations of light in white. This means that there are multiple wavelengths undistinguished and all invariant. Thus, the wavelength of light is interpreted to be changing during transition when we take all of the information in from white, additive color or pigment.

Sampling is the smallest point. We receive an pointilistic impression of the world called a .

A Notational Language for the Light-

Sensitive Psychophysics

by Parker Emmerson for Workshop with Tom Toleno

I. Light through the Arc and Height

Light travels through space, but within its travel is the information that the angular element, akin to time, conveys specific information about the location of contour in perceptual space through a geometric correlation that has the capability of mapping out contour in the visual perception directly by analogy of larger ecology to individual play of ambient light off of a contour. This is an interpretation of spectral energy within Gibson' s terminology of the false puzzle, "the amount of constancy obtained by an observer is pointless" (BRP 169), because the analogy is the conveyor of meaning to consciouss-ness. We will try to show this symbolically as well as directly.

There is information available in the stimulation, but there is also information communicated. A change in the environment, when measuring size, is the polar coordinate expression of the ambient optic array. The change is undergoing, because of a parameter of structure that is invariant, so the disruption in the array specifies the event. That event causes transition and transformation.

$$\left\{\left\{\eta \to -\frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi}\right\}, \left\{\eta \to \frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi}\right\}\right\} \text{ is the height of a cone}$$

in terms of a difference of circumferences, invariant through r, because it is always the slant of the cone and also the value that the base of the cone cannot reach, because once it reaches that value, it is no longer a cone, but collapses to a circle. (196)

$$\text{Solve}\left[\frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi} == \eta, r\right]$$

$$\left\{\left\{r \to -\frac{2\pi\eta}{\sqrt{4\pi\theta - \theta^2}}\right\}, \left\{r \to \frac{2\pi\eta}{\sqrt{4\pi\theta - \theta^2}}\right\}\right\} \tag{197}$$

$$\frac{2\pi\eta}{\sqrt{4\pi\theta - \theta^2}} = r = \frac{2\pi * r * \text{Sin}[\beta]}{\sqrt{4\pi\theta - \theta^2}} \tag{198}$$

Where η is a given height of a cone, and θ the amount of accumulated time of a perception, r*θ being the difference of the change in circumference between two circles that correlates to a height in the third dimension.

$$\text{Note that whatever r is equal to, the equation simplifies to } 1 = \frac{2\pi\ \text{Sin}[\beta]}{\sqrt{4\pi\theta - \theta^2}} \tag{199}$$

The polar graph of this function represents the change in η of a radius through time.

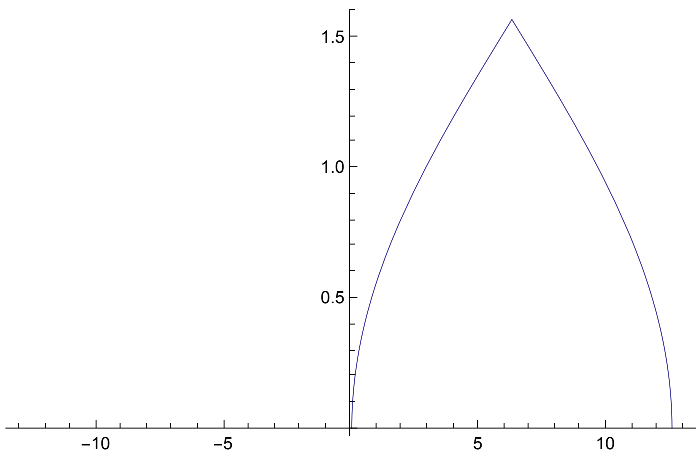
We can solve this equation for β, the angle made by the slant of the cone and the base of the cone,

in terms of theta (the amount of angle involved in folding the circle up into the third dimension when the slant is always equal to the radius.

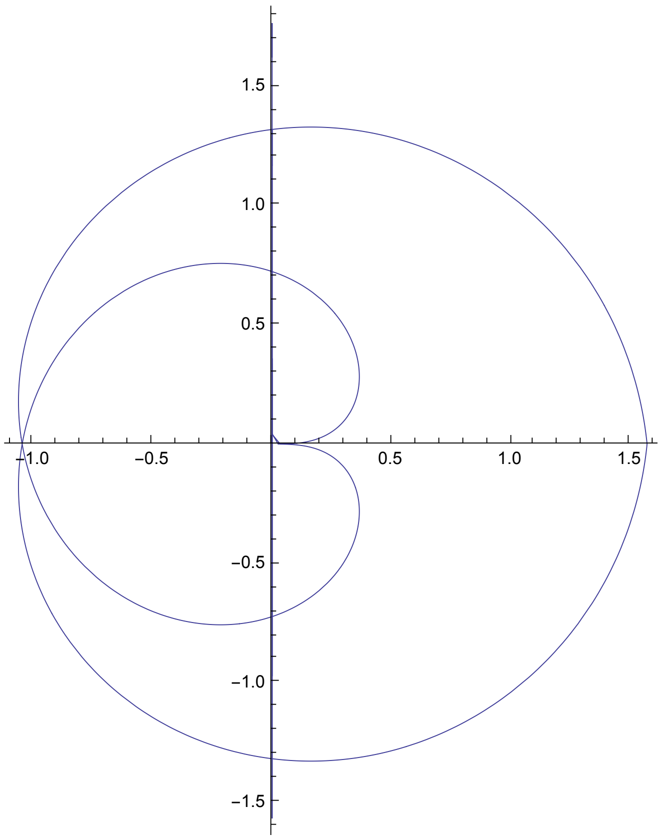
$$\text{Solve}\left[1 == \frac{2\,\pi\ \text{Sin}[\beta]}{\sqrt{4\,\pi\,\theta - \theta^2}},\ \beta\right]$$

$$\left\{\left\{\beta \to \text{ArcSin}\left[\frac{\sqrt{(4\,\pi - \theta)\ \theta}}{2\,\pi}\right]\right\}\right\} \tag{200}$$

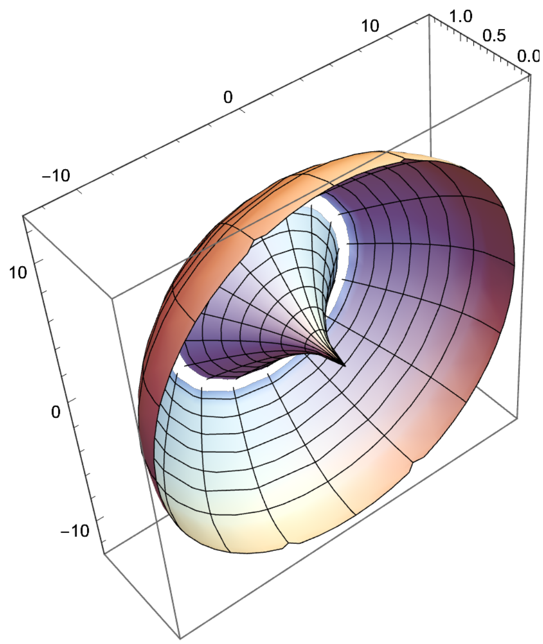
$$\text{Plot}\left[\text{ArcSin}\left[\frac{\sqrt{(4\,\pi - \theta)\ \theta}}{2\,\pi}\right],\ \{\theta,\ -13,\ 13\}\right]$$



$$\text{PolarPlot}\left[\text{ArcSin}\left[\frac{\sqrt{(4\,\pi-\theta)\,\theta}}{2\,\pi}\right],\ \{\theta,\ -13,\ 13\}\right]$$



```
RevolutionPlot3D[ArcSin[Sqrt[(4 π - θ) θ]/(2 π)], {θ, -13, 13}]
```



The field of optical flow, light traveling through the ambient array, I propose, is represented by the polar coordinate graph of a change in radius over time through transformation to being the height of the cone. A revolution deliver information to the perceiver given the intensity, hue, etc. of light. A single revolution of the systme is equivalent to the flow of combined light in the ambient array at the station point of perception.

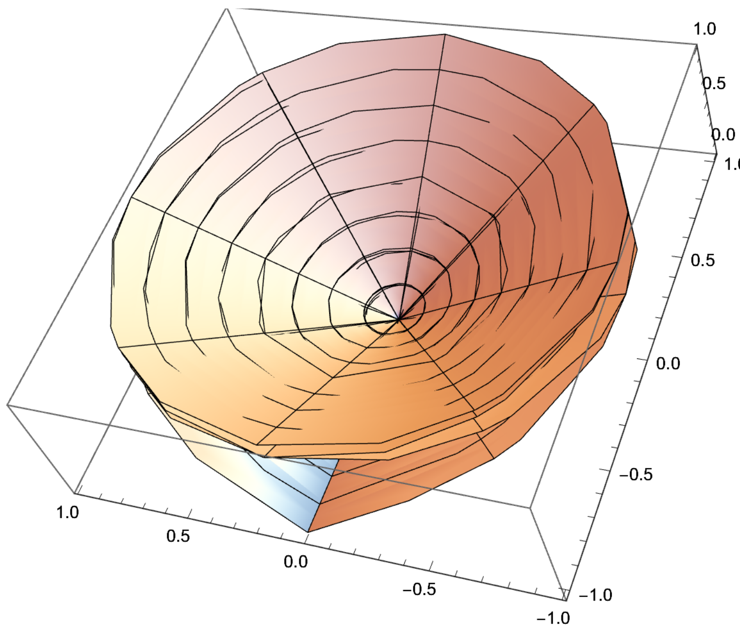
There are ways of solving for the radius in terms of purely the angle, θ. We will examine these nested sets of ways of understanding the point of view. By nested, we mean that depending on how in depth one goes into observing the world or extrapolating a function of light in the array, one will see different visual representations of the structuring of that information that are more or less informationally dense. This will lead to a series of functions that give us introspection into the structuring of light in terms of a cyclic perspective on time. For the system, it is important to realize that in the normal course of parameterizing the motion in the case at hand, θ does not go beyond 4π (i.e. that it sends the height of the cone up to its maximum value and back down over the course of two revolutions of a circle), and that β would not be able to be easily thought of beyond π or 2π (it has a value of π at the maximum height of the transition, and a value of 2π once the cone comes back down from the height).

```
Solve[1 == 2 π Sin[β]/Sqrt[4 π θ - θ^2], θ]
```

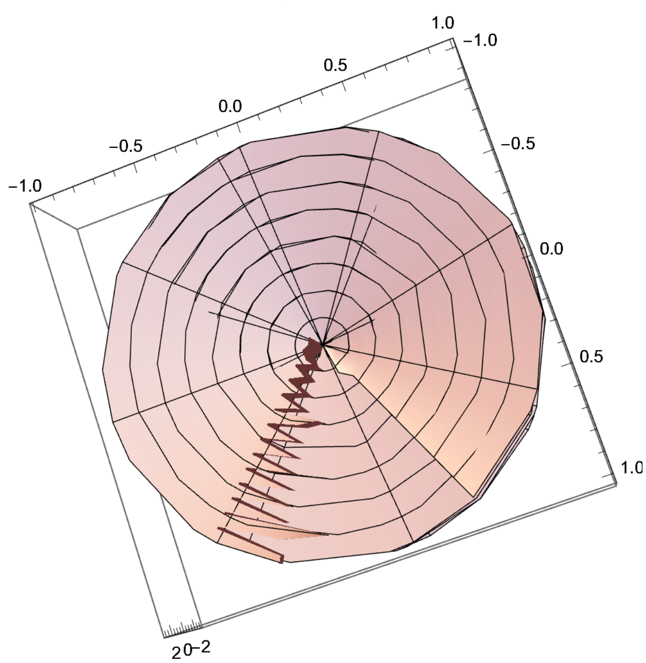
$$\left\{\left\{\theta \to 2\left(\pi - \sqrt{\pi^2 - \pi^2 \mathrm{Sin}[\beta]^2}\right)\right\}, \left\{\theta \to 2\left(\pi + \sqrt{\pi^2 - \pi^2 \mathrm{Sin}[\beta]^2}\right)\right\}\right\} \quad (201)$$

$$\eta \to \frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}$$

```
RevolutionPlot3D[Sqrt[4 π r^2 θ - r^2 θ^2]/(2 π), {r, -1, 1}, {θ, -4 π, 4 π}]
```



```
RevolutionPlot3D[(2 π η)/Sqrt[4 π θ - θ^2], {η, -1, 1}, {θ, -4 π, 4 π}]
```



The Analogy of a Change in Position Relating to a Change in Contour during the

Pickup of Invariants

Gibson has said that, "The theory of information pickup requires perceptual systems, not senses" (BRP 77). Gibson also he subtlety of the perceptual system to learning and time. He thinks that we continue learning to perceive in more detail as time goes on. This will be an important idea when discussing the extrapolation of functions relating to the information in the array over time.

The wavelength of the light we are discussing is the initial radius of the circle. Its path is to the subjective perceiver and a single wavelength.The parameters of the velocity of its travel, or the travel of any substance, are frequency and wavelength.

$$\text{We state that : } v = \lambda f, \text{ where } v \text{ is velocity, } \lambda = r \text{ is wavelength, and } 1 / \text{time} = f = \text{frequency.} \tag{202}$$

$$\text{Time} = 6 \left(\theta_{\text{degrees}}\right) = 6\ (180 / \pi)\ \theta = (1080 / \pi)\ \theta \tag{203}$$

The velocity being discussed is the first derivative of the distance, which is the height of the cone, *η*. A tiny piece of the ambient array would contain within it information regarding information of the surface off of which the light flowing through the array is reflecting. H contains information about the time and initial distance of a wavelength of light.

Information of variable contour is transferred to the perceiver by the flux of information in ambient light through each point in the optic array, represented by item number four. The rate of this variance is analogous to velocity in a rotational system, like the structuring of light through space - time. This is what is meant by information in the light.

Helmholtz proposes that phenomena regarding the visual system can be described by the use of analogy when things begin to look paradoxical. He takes into consideration the psychic faculties and suggests that the processing of the environment and its perceptual phenomena may occur through an unconscious working of analogy in the mind. I find this to be interesting and agreeable. It provides a humanist account through the recognition of biological factors regarding perceptual systems.

The Wavelength with Constant Value

$$v =$$

$$\lambda f = r\ (1 / (1080 / \pi)\ \theta) = (1 / (1080 / \pi))\ D\left[\frac{\sqrt{4 \pi r^2 \theta - r^2 \theta^2}}{2 \pi}, \theta\right] = \frac{4 \pi r^2 - 2 r^2 \theta}{4320 \sqrt{4 \pi r^2 \theta - r^2 \theta^2}}$$

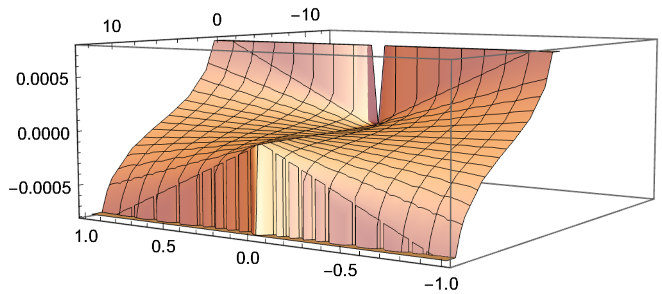
We will try to build up as many functions as possible without resorting to designating something to be having a velocity of light or non - light. It is simply a velocity for the time being. This way, we will have access to a realm of general functions of correlated variables.

$$(1 / (1080 / \pi))\ D\left[\frac{\sqrt{4 \pi r^2 \theta - r^2 \theta^2}}{2 \pi}, \theta\right]$$

$$\frac{4 \pi r^2 - 2 r^2 \theta}{4320 \sqrt{4 \pi r^2 \theta - r^2 \theta^2}}$$

Velocity when r is constant $= \dfrac{4 \pi r^2 - 2 r^2 \theta}{4320 \sqrt{4 \pi r^2 \theta - r^2 \theta^2}}$

$$\text{Plot3D}\left[\frac{4 \pi r^2 - 2 r^2 \theta}{4320 \sqrt{4 \pi r^2 \theta - r^2 \theta^2}}, \{r, -1, 1\}, \{\theta, -4\pi, 4\pi\}\right]$$



We also have access to the equation,

$$\frac{4 \pi r^2 - 2 r^2 \theta}{4320 \sqrt{4 \pi r^2 \theta - r^2 \theta^2}} == r\ (1 / (1080 / \pi)\ \theta), \tag{204}$$

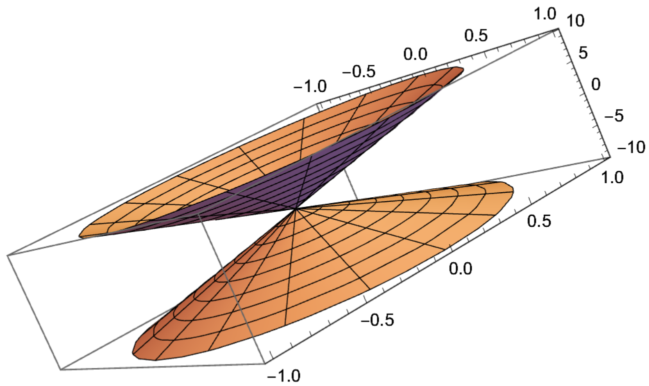
which winds up having the r variable cancel out,
and delivers three exact solutions for theta.

$$\text{Solve}\left[\frac{4 \pi r^2 - 2 r^2 \theta}{4320 \sqrt{4 \pi r^2 \theta - r^2 \theta^2}} == r\ (1 / ((1080 / \pi)\ \theta)), \theta\right]$$

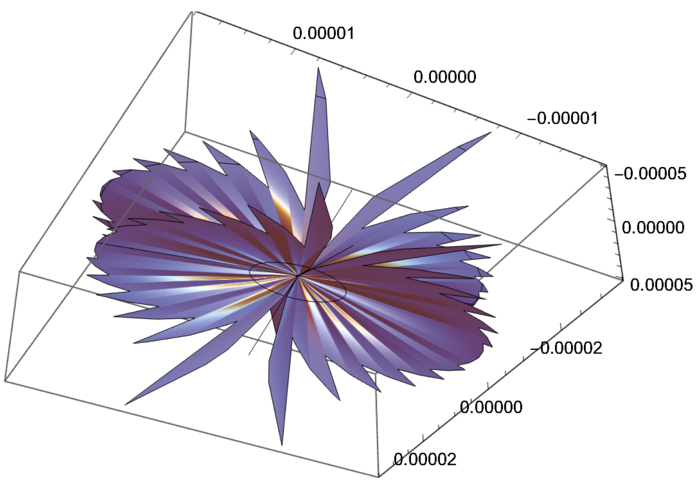
$$\left\{\left\{\theta \to \frac{2}{3}\left(2 \pi - \frac{2 \pi}{\left(17 + 3 \sqrt{33}\right)^{1/3}} + \left(17 + 3 \sqrt{33}\right)^{1/3} \pi\right)\right\},\right.$$
$$\left\{\theta \to \frac{4 \pi}{3} + \frac{2\left(1 + i \sqrt{3}\right) \pi}{3\left(17 + 3 \sqrt{33}\right)^{1/3}} - \frac{1}{3}\left(1 - i \sqrt{3}\right)\left(17 + 3 \sqrt{33}\right)^{1/3} \pi\right\}, \tag{205}$$
$$\left.\left\{\theta \to \frac{4 \pi}{3} + \frac{2\left(1 - i \sqrt{3}\right) \pi}{3\left(17 + 3 \sqrt{33}\right)^{1/3}} - \frac{1}{3}\left(1 + i \sqrt{3}\right)\left(17 + 3 \sqrt{33}\right)^{1/3} \pi\right\}\right\}$$

We will note that an arc length is equal to r**θ*. Thus, we will be able to see what the arc length is, because it represents the change in circumference of two circles. In this case, as the circle, viewed from head on, recedes from the perceiver into the distance, it gets smaller. This is a change in amount of surface area taken up on the retinal image, but also a way of visualizing the imaginary solutions the time element of waves traveling in space.

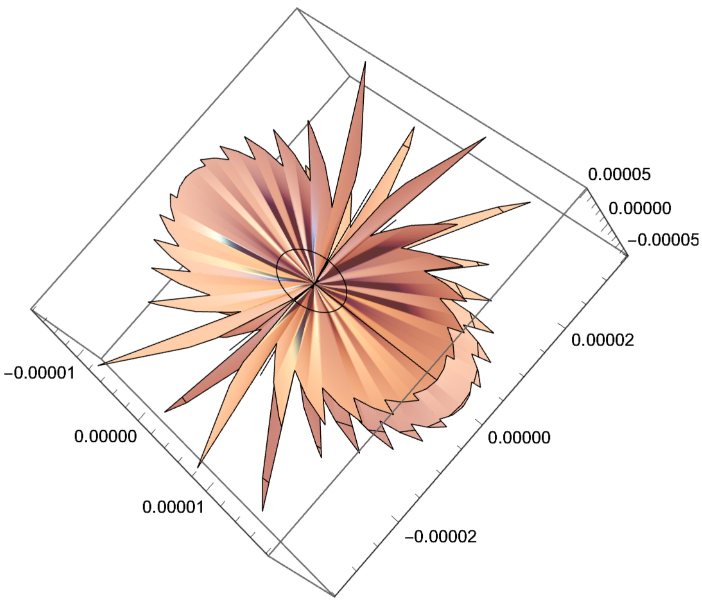
$$\texttt{RevolutionPlot3D}\left[\texttt{r}\,\frac{2}{3}\left(2\,\pi-\frac{2\,\pi}{\left(17+3\,\sqrt{33}\right)^{1/3}}+\left(17+3\,\sqrt{33}\right)^{1/3}\pi\right),\,\{\texttt{r},\,-1,\,1\}\right]$$



$$\texttt{RevolutionPlot3D}\left[\texttt{r}\left(\frac{4\,\pi}{3}+\frac{2\left(1+\mathbb{i}\,\sqrt{3}\right)\pi}{3\left(17+3\,\sqrt{33}\right)^{1/3}}-\frac{1}{3}\left(1-\mathbb{i}\,\sqrt{3}\right)\left(17+3\,\sqrt{33}\right)^{1/3}\pi\right),\,\{\texttt{r},\,-1,\,1\}\right]$$



```
RevolutionPlot3D[r (4π/3 + (2 (1 - i √3) π)/(3 (17 + 3 √33)^(1/3)) - 1/3 (1 + i √3) (17 + 3 √33)^(1/3) π), {r, -1, 1}]
```



When combined, the three imaginary solutions form a cone, but seperately, they exist primarily in the complex plane. It requires all three solutions to deliver information of depth to the perceiver through light in terms of the real. In Gibson' s theory, depth is intimately connected with contour. Contour is delivered by the pickup of the invariant, r, in the ambient array, changing context in a different way from point to point. Thus, understanding of two truths in the real world like information given to the perceiver of an object by an edge, for instance is enabled.

Mach begins by verifying a belief in the space - sense, an area of parameterized space relating the sense of an individual to the stimulus in the world. The space - sense provides a workspace for the individual senses like sense of sight and touch to enable a perceptual experience.“ The perception of Depth depends on extra - occular experiences” (BRP 118) is an idea that makes a great deal of sense to me, because when we experience or perceive truth, we use multiple faculties to make sense of a phenomenon.

The Wavelength with Changing Value during a Transition

The initial radius changes contexts, but can it be said to actually change? The wavelength, r, could be said to be changing if we consider that $\Delta r = r - r_1$. Although it is invariant in the context of always being the slant of the cone, it changes when understood to be the base of a cone. The height of the cone starts at zero and goes toward the locus of perception, which is the subjective perceiver. In the ambient array, many different wavelengths are present. It is reasonable, then to think that a wavelength could change during the course of traveling a single wavelength. When the circle is infinitely far away, it has a perceived radius of 0. It is important to discuss the ecological context of the meaning of the array. The initial radius could be thought of being analogous to the monocular field of vision.

$$v = \lambda f = r\,(1/(1080/\pi)\,\theta) = (1/(1080/\pi))\, D\left[\frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi}, r, \theta\right] \tag{206}$$

$$(1/(1080/\pi))\, D\left[\frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi}, r, \theta\right]$$

$$\frac{\pi\left(-\frac{(4\pi r^2 - 2 r^2 \theta)(8\pi r \theta - 2 r \theta^2)}{8\pi (4\pi r^2 \theta - r^2 \theta^2)^{3/2}} + \frac{8\pi r - 4 r \theta}{4\pi \sqrt{4\pi r^2 \theta - r^2 \theta^2}}\right)}{1080} = \text{velocity during a transition} \tag{206}$$

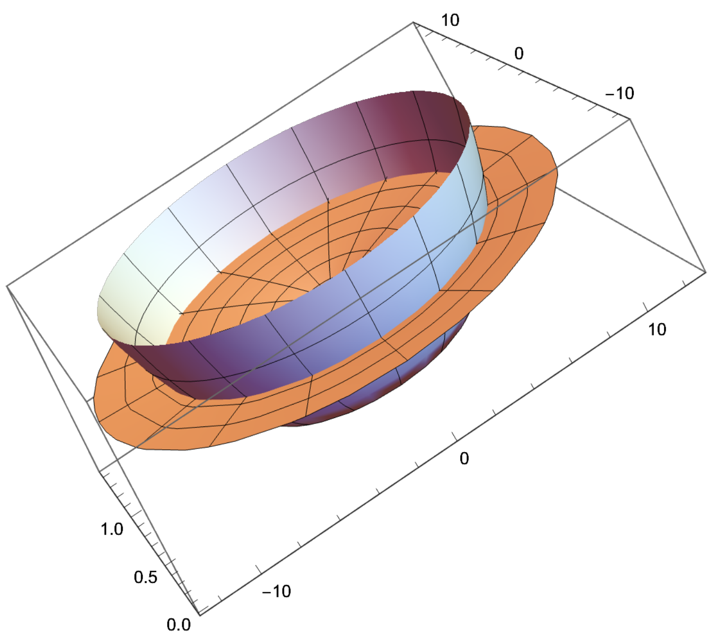
$$(1080/\pi)\,\theta = \text{time} \tag{207}$$

$$\frac{2\pi v t}{\sqrt{4\pi\theta - \theta^2}} = \frac{2\pi v\,(1080/\pi)\,\theta}{\sqrt{4\pi\theta - \theta^2}} = \frac{2\pi \frac{\pi\left(-\frac{(4\pi r^2 - 2 r^2 \theta)(8\pi r \theta - 2 r \theta^2)}{8\pi (4\pi r^2 \theta - r^2 \theta^2)^{3/2}} + \frac{8\pi r - 4 r \theta}{4\pi \sqrt{4\pi r^2 \theta - r^2 \theta^2}}\right)}{1080} (1080/\pi)\,\theta}{\sqrt{4\pi\theta - \theta^2}} \tag{208}$$

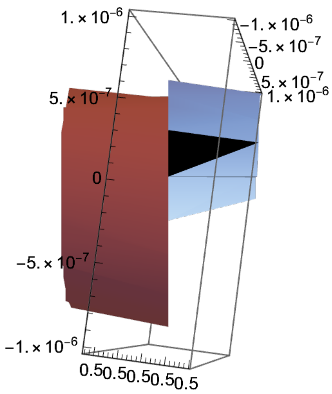
$$\text{Solve}\left[r == \frac{2 * \left(\frac{\pi\left(-\frac{(4\pi r^2 - 2 r^2 \theta)(8\pi r \theta - 2 r \theta^2)}{8\pi (4\pi r^2 \theta - r^2 \theta^2)^{3/2}} + \frac{8\pi r - 4 r \theta}{4\pi \sqrt{4\pi r^2 \theta - r^2 \theta^2}}\right)}{1080}\right) * 6\,((180/\pi)\,\theta) * \pi}{\sqrt{4\pi\theta - (\theta)^2}}, r\right]$$

$$\left\{\left\{r \to -\sqrt{1 + \frac{4\pi^2}{(4\pi - \theta)^2} - \frac{4\pi}{4\pi - \theta}}\right\}, \left\{r \to \sqrt{1 + \frac{4\pi^2}{(4\pi - \theta)^2} - \frac{4\pi}{4\pi - \theta}}\right\}\right\}$$

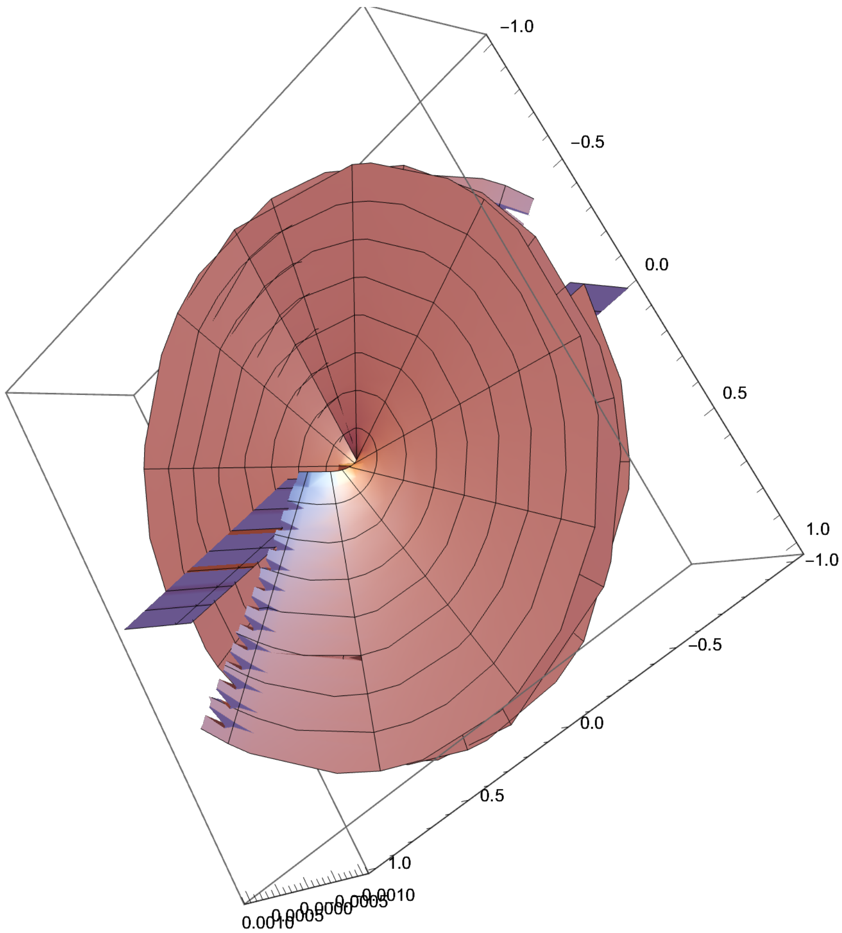
$$\text{RevolutionPlot3D}\left[\sqrt{1 + \frac{4\pi^2}{(4\pi - \theta)^2} - \frac{4\pi}{4\pi - \theta}}, \{\theta, -4\pi, 4\pi\}\right]$$



$$\texttt{RevolutionPlot3D}\left[\sqrt{1+\frac{4\,\pi^2}{(4\,\pi-\theta)^2}-\frac{4\,\pi}{4\,\pi-\theta}},\ \{\theta,\ -.000001,\ .0000001\}\right]$$



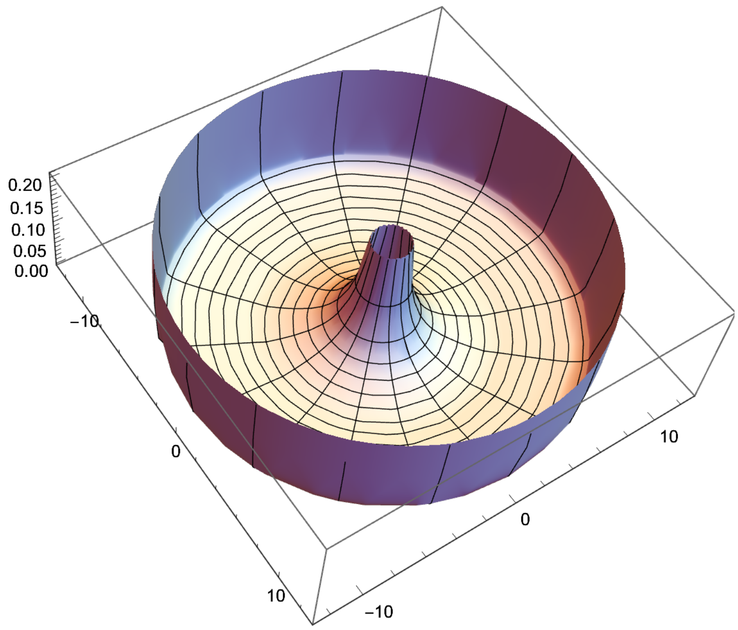
$$\text{RevolutionPlot3D}\left[\frac{\pi\left(-\frac{(4\pi r^2-2r^2\theta)(8\pi r\theta-2r\theta^2)}{8\pi(4\pi r^2\theta-r^2\theta^2)^{3/2}}+\frac{8\pi r-4r\theta}{4\pi\sqrt{4\pi r^2\theta-r^2\theta^2}}\right)}{1080},\{r,-1,1\},\{\theta,-3\pi,3\pi\}\right]$$



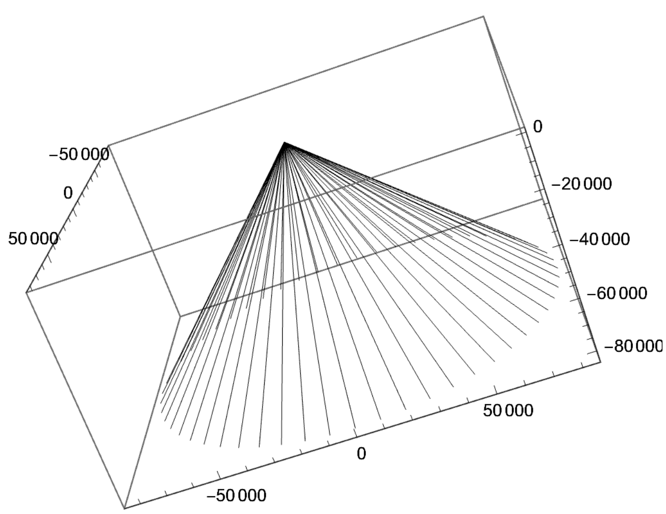
$$\text{Solve}\left[\frac{\pi\left(-\frac{(4\pi r^2-2r^2\theta)(8\pi r\theta-2r\theta^2)}{8\pi(4\pi r^2\theta-r^2\theta^2)^{3/2}}+\frac{8\pi r-4r\theta}{4\pi\sqrt{4\pi r^2\theta-r^2\theta^2}}\right)}{1080}==r\,(1/(1080/\pi)\,\theta),r\right]$$

$$\left\{\left\{r\to-\frac{\sqrt{\frac{1}{4\pi-\theta}+\frac{4\pi}{\theta^2}-\frac{3}{\theta}}}{4\pi\sqrt{\theta}}\right\},\left\{r\to\frac{\sqrt{\frac{1}{4\pi-\theta}+\frac{4\pi}{\theta^2}-\frac{3}{\theta}}}{4\pi\sqrt{\theta}}\right\}\right\}$$

$$\text{RevolutionPlot3D}\left[\frac{\sqrt{\frac{1}{4\,\pi-\theta}+\frac{4\,\pi}{\theta^{2}}-\frac{3}{\theta}}}{4\,\pi\,\sqrt{\theta}},\ \{\theta,\ -13,\ 13\}\right]$$



$$\text{RevolutionPlot3D}\left[\left\{\frac{\sqrt{\frac{1}{4\,\pi-\theta}+\frac{4\,\pi}{\theta^{2}}-\frac{3}{\theta}}}{4\,\pi\,\sqrt{\theta}},\ -\frac{\sqrt{\frac{1}{4\,\pi-\theta}+\frac{4\,\pi}{\theta^{2}}-\frac{3}{\theta}}}{4\,\pi\,\sqrt{\theta}}\right\},\ \{\theta,\ -13,\ 13\}\right]$$



This shows us that the parametric structure of our system still holds when the consideration that the wavelength of light, r, changes during transition. This leads to some evidence for Gibson's idea of an invariant in the structure of light.

$$\text{Solve}\left[\frac{\pi\left(-\frac{\left(4\pi r^2-2r^2\theta\right)\left(8\pi r\theta-2r\theta^2\right)}{8\pi\left(4\pi r^2\theta-r^2\theta^2\right)^{3/2}}+\frac{8\pi r-4r\theta}{4\pi\sqrt{4\pi r^2\theta-r^2\theta^2}}\right)}{1080}==r\,(1/(1080/\pi)\,\theta),\,\theta\right]$$

$$\text{RevolutionPlot3D}\Big[$$

$$\Bigg\{\Bigg\{\pi-\frac{1}{2}\sqrt{\left(4\pi^2-\frac{1}{6\pi^2 r^2}+\frac{1}{12\pi^2 r^2\left(1+13\,824\,\pi^8 r^4-96\sqrt{3}\,\pi^4\sqrt{r^4+6912\,\pi^8 r^8}\right)^{1/3}}+\frac{\left(1+13\,824\,\pi^8 r^4-96\sqrt{3}\,\pi^4\sqrt{r^4+6912\,\pi^8 r^8}\right)^{1/3}}{12\pi^2 r^2}\right)}-$$

$$\left.\left.\left.\left.\frac{\left(1+13\,824\,\pi^8\,r^4-96\,\sqrt{3}\,\pi^4\,\sqrt{r^4+6912\,\pi^8\,r^8}\right)^{1/3}}{12\,\pi^2\,r^2}\right)\right)\right)\right\},$$

$$\left\{\pi+\frac{1}{2}\sqrt{\left(4\,\pi^2-\frac{1}{6\,\pi^2\,r^2}+\frac{1}{12\,\pi^2\,r^2\left(1+13\,824\,\pi^8\,r^4-96\,\sqrt{3}\,\pi^4\,\sqrt{r^4+6912\,\pi^8\,r^8}\right)^{1/3}}+\right.}\right.$$

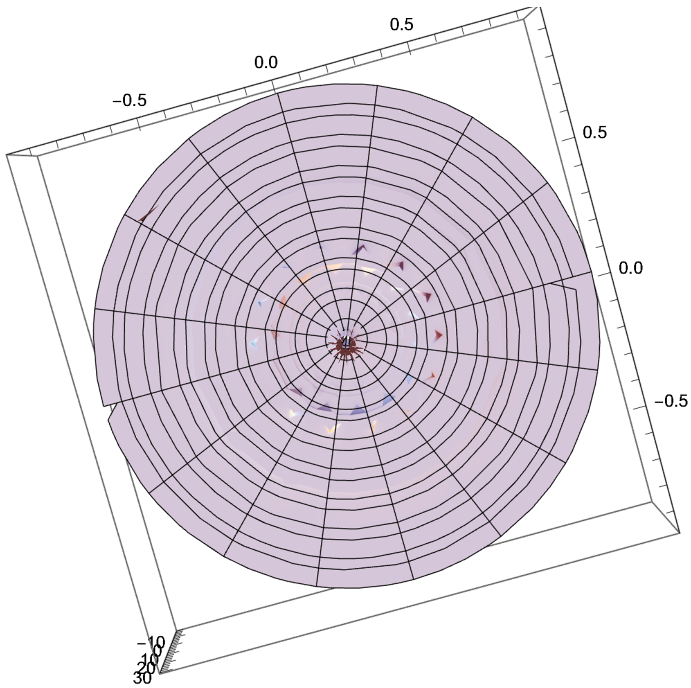
$$\left.\frac{\left(1+13\,824\,\pi^8\,r^4-96\,\sqrt{3}\,\pi^4\,\sqrt{r^4+6912\,\pi^8\,r^8}\right)^{1/3}}{12\,\pi^2\,r^2}\right)+$$

$$\frac{1}{2}\sqrt{\left(8\,\pi^2-\frac{1}{3\,\pi^2\,r^2}-\frac{1}{12\,\pi^2\,r^2\left(1+13\,824\,\pi^8\,r^4-96\,\sqrt{3}\,\pi^4\,\sqrt{r^4+6912\,\pi^8\,r^8}\right)^{1/3}}-\right.}$$

$$\frac{\left(1+13\,824\,\pi^8\,r^4-96\,\sqrt{3}\,\pi^4\,\sqrt{r^4+6912\,\pi^8\,r^8}\right)^{1/3}}{12\,\pi^2\,r^2}+\left(64\,\pi^3+\frac{4}{\pi\,r^2}\right)\Big/$$

$$\left(4\sqrt{\left(4\,\pi^2-\frac{1}{6\,\pi^2\,r^2}+\frac{1}{12\,\pi^2\,r^2\left(1+13\,824\,\pi^8\,r^4-96\,\sqrt{3}\,\pi^4\,\sqrt{r^4+6912\,\pi^8\,r^8}\right)^{1/3}}+\right.}\right.$$

$$\frac{\left(1+13824\,\pi^8\,r^4-96\,\sqrt{3}\,\pi^4\,\sqrt{r^4+6912\,\pi^8\,r^8}\right)^{1/3}}{12\,\pi^2\,r^2}\Bigg)\Bigg)\Bigg)\Bigg\}\Bigg\}\text{, \{r, -1, 1\}}\Bigg]$$



In this wheel, when viewing it from head on, we see the entire rainbow of colors in terms of contour of a surface.

We recently found out that these are all valid statements for r, even when it is considered to be changing during a transition.

$$r = \pm\frac{2\,\pi * r * \text{Sin}[\beta]}{\sqrt{4\,\pi\,\theta-\theta^2}} = \pm\frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta-\theta^2}} = \pm\frac{\sqrt{\frac{1}{4\,\pi-\theta}+\frac{4\,\pi}{\theta^2}-\frac{3}{\theta}}}{4\,\pi\,\sqrt{\theta}}$$

We can find out what η, the height of the cone is in terms of theta alone from this relation when r is changing.

$$\text{Solve}\left[\frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta-\theta^2}} == \frac{\sqrt{\frac{1}{4\,\pi-\theta}+\frac{4\,\pi}{\theta^2}-\frac{3}{\theta}}}{4\,\pi\,\sqrt{\theta}},\,\eta\right]$$

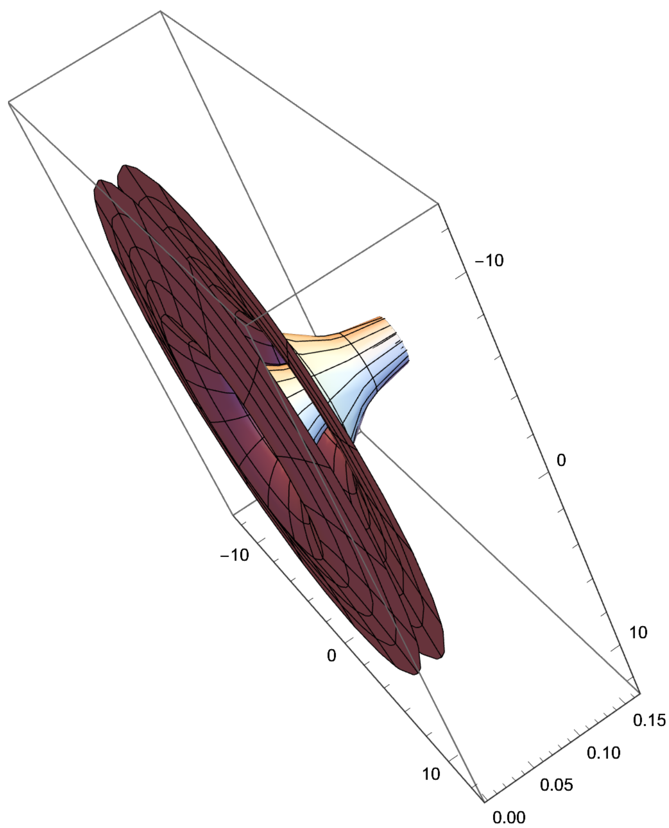
$$\left\{\left\{\eta\to\frac{\sqrt{\frac{1}{4\,\pi-\theta}+\frac{4\,\pi}{\theta^2}-\frac{3}{\theta}}\,\sqrt{4\,\pi\,\theta-\theta^2}}{8\,\pi^2\,\sqrt{\theta}}\right\}\right\}$$

When r = η, the circle will have gone around 2 π degrees. If the relations for a changing r hold, then we should arive at that answer.

$$\text{Solve}\left[\frac{\sqrt{\frac{1}{4\pi-\theta}+\frac{4\pi}{\theta^2}-\frac{3}{\theta}}}{4\pi\sqrt{\theta}} == \frac{\sqrt{\frac{1}{4\pi-\theta}+\frac{4\pi}{\theta^2}-\frac{3}{\theta}}\ \sqrt{4\pi\theta-\theta^2}}{8\pi^2\sqrt{\theta}}, \theta\right]$$

$$\{\{\theta \to 2\pi\}\}$$

$$\text{RevolutionPlot3D}\left[\frac{\sqrt{\frac{1}{4\pi-\theta}+\frac{4\pi}{\theta^2}-\frac{3}{\theta}}\ \sqrt{4\pi\theta-\theta^2}}{8\pi^2\sqrt{\theta}}, \{\theta, -4\pi, 4\pi\}\right]$$



$$\text{Solve}\left[\frac{2\pi * r * \text{Sin}[\beta]}{\sqrt{4\pi\theta-\theta^2}} == \frac{\sqrt{\frac{1}{4\pi-\theta}+\frac{4\pi}{\theta^2}-\frac{3}{\theta}}}{4\pi\sqrt{\theta}}, r\right]$$

We will also introduce the idea of a platform into which we can place
 different objects. These objects will interact with the platform,
which is also another kind of object.
```

A Notational Language for the Light-Sensitive Psychophysics

I. Light through the Arc and Height

Light travels through space, but within its travel is the information that the angular element, akin to time, conveys specific information about the location of contour in perceptual space through a geometric correlation that has the capability of mapping out contour in the visual perception directly by analogy of larger ecology to individual play of ambient light off of a contour. This is an interpretation of spectral energy within Gibson' s terminology of the false puzzle, "the amount of constancy obtained by an observer is pointless" (BRP 169), because the analogy is the conveyor of meaning to consciouss-ness. We will try to show this symbolically as well as directly.

There is information available in the stimulation, but there is also information communicated. A change in the environment, when measuring size, is the polar coordinate expression of the ambient optic array. The change is undergoing, because of a parameter of structure that is invariant, so the disruption in the array specifies the event. That event causes transition and transformation. Physical

space uses mathematics to describe time in specifically a linear way. Psychophysical, or perceptual space is focused primarily on the event of perception, thus it uses a cyclic interpretation of the time element to the mathematical correlations.

$$\left\{\left\{\eta \to -\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}\right\}, \left\{\eta \to \frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}\right\}\right\}$$ is the height of a cone in terms of a difference of circumferences, invariant through r, because it is always the slant of the cone and also the value that the base of the cone cannot reach, because once it reaches that value, it is no longer a cone, but collapses to a circle. (209)

Solve$\left[\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi} == \eta,\ r\right]$

$$\left\{\left\{r \to -\frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta - \theta^2}}\right\}, \left\{r \to \frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta - \theta^2}}\right\}\right\} \tag{210}$$

$$\frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta - \theta^2}} = r = \frac{2\,\pi * r * \mathrm{Sin}[\beta]}{\sqrt{4\,\pi\,\theta - \theta^2}} \tag{211}$$

Where η is a given height of a cone, and θ the amount of accumulated time during transition, r*θ is the difference of the change in circumference between two circles that correlates to a height in the third dimension.

Note that whatever r is equal to, the equation simplifies to $1 = \frac{2\,\pi\ \mathrm{Sin}[\beta]}{\sqrt{4\,\pi\,\theta - \theta^2}}$ (212)

The polar graph of this function represents the change in η of a radius through time.

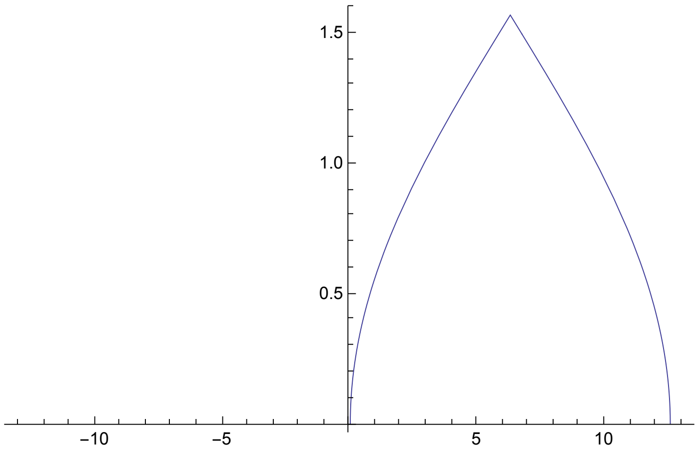
We can solve this equation for β, the angle made by the slant of the cone and the base of the cone, in terms of theta (the amount of angle involved in folding the circle up into the third dimension when the slant is always equal to the radius.

Solve$\left[1 == \frac{2\,\pi\ \mathrm{Sin}[\beta]}{\sqrt{4\,\pi\,\theta - \theta^2}},\ \beta\right]$

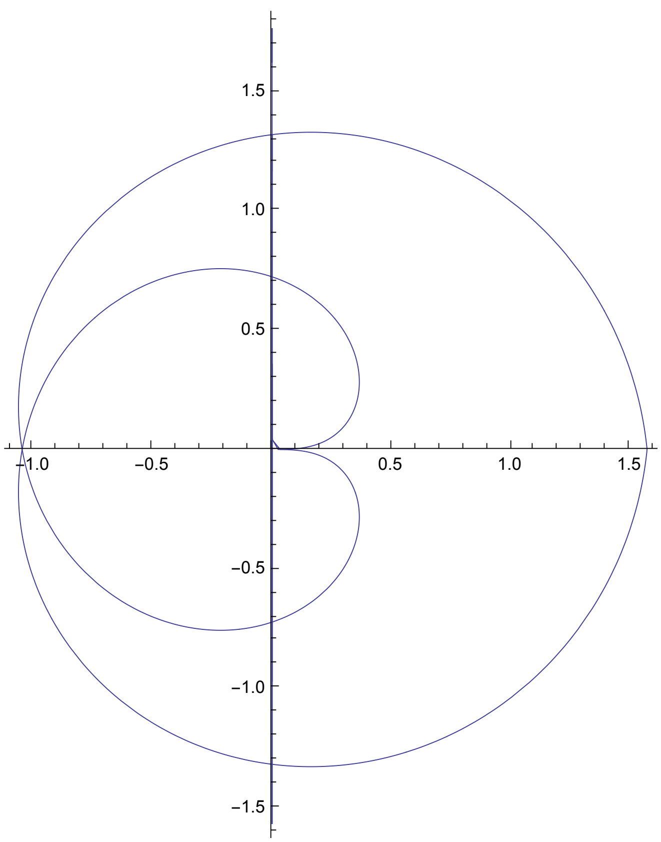
$$\left\{\left\{\beta \to \mathrm{ArcSin}\left[\frac{\sqrt{(4\,\pi - \theta)\,\theta}}{2\,\pi}\right]\right\}\right\} \tag{213}$$

```
Plot[ArcSin[Sqrt[(4 π - θ) θ]/(2 π)], {θ, -13, 13}]
```

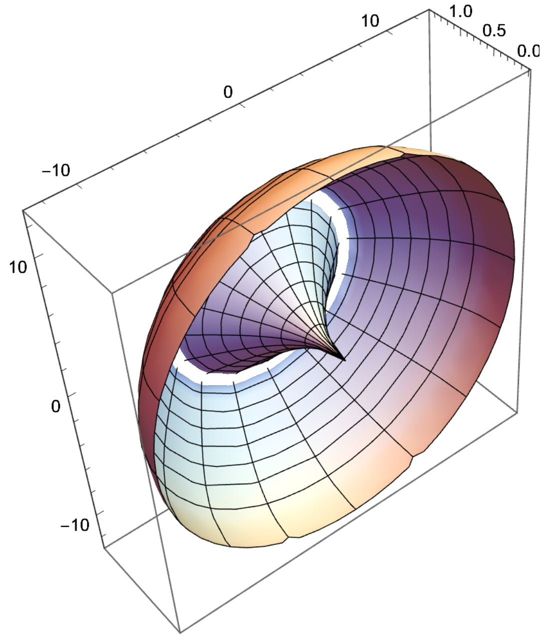
$$\text{Plot}\left[\text{ArcSin}\left[\frac{\sqrt{(4\,\pi-\theta)\,\theta}}{2\,\pi}\right],\{\theta,-13,13\}\right]$$



$$\text{PolarPlot}\left[\text{ArcSin}\left[\frac{\sqrt{(4\,\pi-\theta)\,\theta}}{2\,\pi}\right],\{\theta,-13,13\}\right]$$



```
RevolutionPlot3D[ArcSin[√((4 π - θ) θ) / (2 π)], {θ, -13, 13}]
```



```
Ian said, "We were chased through tunnels by five million dragons.
James replied, "We should kill all of them with a sword."
Parker thought,
"It is these two bricks of sugar called cookies that is meaning throughness."
```

The field of optical flow, light traveling through the ambient array, I propose, is represented by the polar coordinate graph of a change in radius of the base of a cone over time through transition to being the height of the cone. A revolution delivers information to the perceiver given the intensity, hue, etc. of light. A single revolution of the systme is equivalent to the flow of combined light in the ambient array at the station point of perception or at a single, tiny piece of the array.

There are ways of solving for the radius in terms of purely the angle, θ. We will examine these nested sets of ways of understanding the point of view. By nested, we mean that depending on how in depth one goes into observing the world or extrapolating a function of light in the array, one will see different visual representations of the structuring of that information that are more or less informationally dense.

This will lead to a series of functions that give us introspection into the structuring of light in terms of a cyclic perspective on time. For the system, it is important to realize that in the normal course of parameterizing the motion in the case at hand, θ does not go beyond 4π (i.e. that it sends the height of the cone up to its maximum value and back down over the course of two revolutions of a circle), and that β would not be able to be easily thought of beyond π or 2π (it has a value of π at the maximum

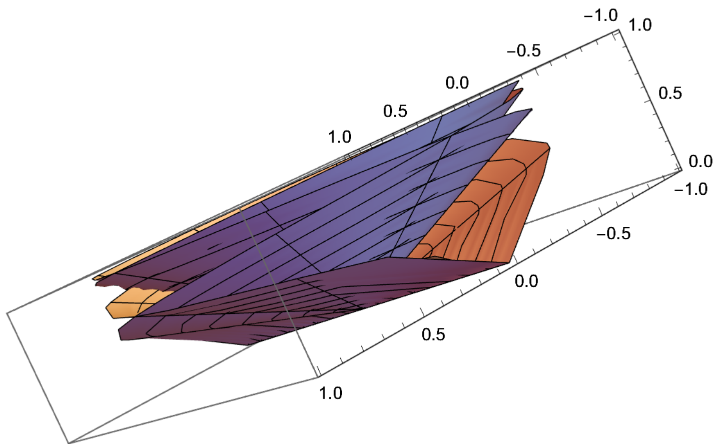
height of the transition, and a value of 2 π once the cone comes back down from the height).

$$\text{Solve}\left[1 == \frac{2\,\pi\ \text{Sin}[\beta]}{\sqrt{4\,\pi\,\theta - \theta^2}},\ \theta\right]$$

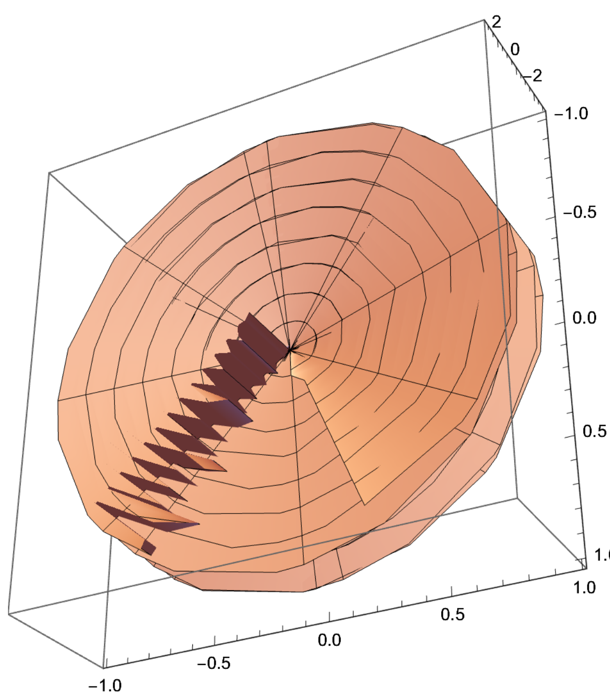
$$\left\{\left\{\theta \to 2\left(\pi - \sqrt{\pi^2 - \pi^2\ \text{Sin}[\beta]^2}\right)\right\},\ \left\{\theta \to 2\left(\pi + \sqrt{\pi^2 - \pi^2\ \text{Sin}[\beta]^2}\right)\right\}\right\} \tag{214}$$

$$\eta \to \frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi}$$

$$\text{RevolutionPlot3D}\left[\frac{\sqrt{4\,\pi\,r^2\,\theta - r^2\,\theta^2}}{2\,\pi},\ \{r,\ -1,\ 1\},\ \{\theta,\ -4\,\pi,\ 4\,\pi\}\right]$$



$$\text{RevolutionPlot3D}\left[\frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta - \theta^2}},\ \{\eta,\ -1,\ 1\},\ \{\theta,\ -4\,\pi,\ 4\,\pi\}\right]$$



From this, we can visually see that each small piece of the ambient array contains within it a certain kind of contour that relates directly to the height and angle of the transition within that piece of contour and the growing ecological contour that maps out objects in the world for visual perception.

The Analogy of a Change in Position Relating to a Change in Contour during the Pickup of Invariants

Gibson has said that, "The theory of information pickup requires perceptual systems, not senses" (BRP 77). Gibson also he subtlety of the perceptual system to learning and time. He thinks that we continue learning to perceive in more detail as time goes on. This will be an important idea when discussing the extrapolation of functions relating to the information in the array over time.

The wavelength of the light we are discussing is the initial radius of the circle. Its path is to the subjective perceiver and a single wavelength.The parameters of the velocity of its travel, or the travel of any substance, are frequency and wavelength.

$$\text{We state that : } v = \lambda f, \text{ where } v \text{ is velocity, } \lambda = r \text{ is wavelength, and } 1/\text{time} = f = \text{frequency.} \tag{215}$$

$$\text{Time} = 6\,(\theta_{\text{degrees}}) = 6\,(180/\pi)\,\theta = (1080/\pi)\,\theta \tag{216}$$

The velocity being discussed is the first derivative of the distance, which is the height of the cone, η. A tiny piece of the ambient array would contain within it information regarding information of the surface off of which the light flowing through the array is reflecting. H contains information about the time and initial distance of a wavelength of light.

Information of variable contour is transferred to the perceiver by the flux of information in ambient light through each point in the optic array, represented by item number four. The rate of this variance is analogous to velocity in a rotational system, like the structuring of light through space - time. This is what is meant by information in the light.

Helmholtz proposes that phenomena regarding the visual system can be described by the use of analogy when things begin to look paradoxical. He takes into consideration the psychic faculties and suggests that the processing of the environment and its perceptual phenomena may occur through an unconscious working of analogy in the mind. I find this to be interesting and agreeable. It provides a humanist account through the recognition of biological factors regarding perceptual systems.

The Wavelength with Constant Value

$$v =$$

$$\lambda f = r\,(1/(1080/\pi)\,\theta) = (1/(1080/\pi))\,D\left[\frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}, \theta\right] = \frac{4\pi r^2 - 2 r^2\theta}{4320\sqrt{4\pi r^2\theta - r^2\theta^2}}$$

We will try to build up as many functions as possible without resorting to designating something to be having a velocity of light or non - light. It is simply a velocity for the time being. This way, we will

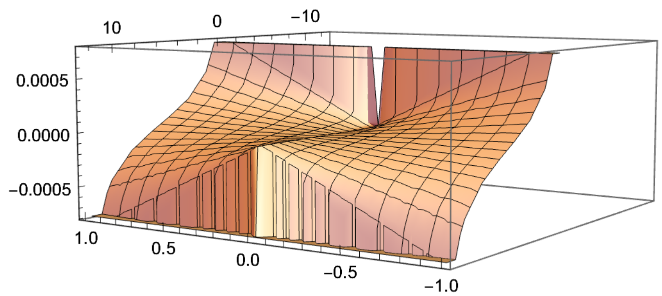
have access to a realm of general functions of correlated variables.

$$(1 / (1080 / \pi))\ D\left[\frac{\sqrt{4\pi r^2 \theta - r^2 \theta^2}}{2\pi}, \theta\right]$$

$$\frac{4\pi r^2 - 2 r^2 \theta}{4320 \sqrt{4\pi r^2 \theta - r^2 \theta^2}}$$

Velocity when r is constant $= \dfrac{4\pi r^2 - 2 r^2 \theta}{4320 \sqrt{4\pi r^2 \theta - r^2 \theta^2}}$

$$\text{Plot3D}\left[\frac{4\pi r^2 - 2 r^2 \theta}{4320 \sqrt{4\pi r^2 \theta - r^2 \theta^2}}, \{r, -1, 1\}, \{\theta, -4\pi, 4\pi\}\right]$$



We also have access to the equation,

$$\frac{4\pi r^2 - 2 r^2 \theta}{4320 \sqrt{4\pi r^2 \theta - r^2 \theta^2}} == r\,(1 / (1080 / \pi)\ \theta), \tag{217}$$

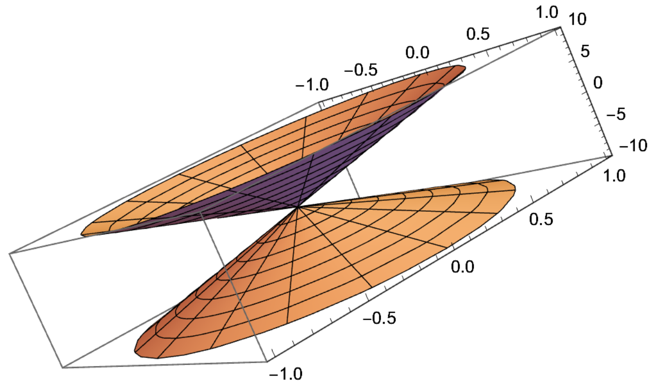
which winds up having the r variable cancel out,
and delivers three exact solutions for theta.

$$\text{Solve}\left[\frac{4\pi r^2 - 2 r^2 \theta}{4320 \sqrt{4\pi r^2 \theta - r^2 \theta^2}} == r\,(1 / ((1080 / \pi)\ \theta)), \theta\right]$$

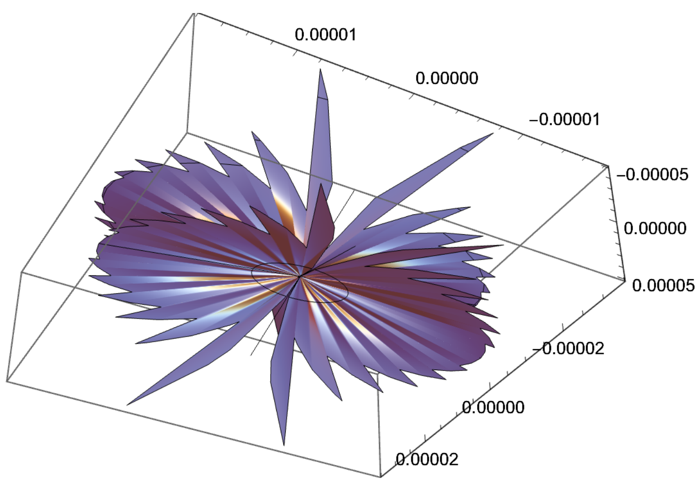
$$\begin{aligned}&\left\{\left\{\theta \to \frac{2}{3}\left(2\pi - \frac{2\pi}{\left(17 + 3\sqrt{33}\right)^{1/3}} + \left(17 + 3\sqrt{33}\right)^{1/3}\pi\right)\right\},\right.\\ &\left\{\theta \to \frac{4\pi}{3} + \frac{2\left(1 + i\sqrt{3}\right)\pi}{3\left(17 + 3\sqrt{33}\right)^{1/3}} - \frac{1}{3}\left(1 - i\sqrt{3}\right)\left(17 + 3\sqrt{33}\right)^{1/3}\pi\right\},\\ &\left.\left\{\theta \to \frac{4\pi}{3} + \frac{2\left(1 - i\sqrt{3}\right)\pi}{3\left(17 + 3\sqrt{33}\right)^{1/3}} - \frac{1}{3}\left(1 + i\sqrt{3}\right)\left(17 + 3\sqrt{33}\right)^{1/3}\pi\right\}\right\}\end{aligned} \tag{218}$$

We will note that an arc length is equal to r*θ. Thus, we will be able to see what the arc length is, because it represents the change in circumference of two circles. In this case, as the circle, viewed from head on, recedes from the perceiver into the distance, it gets smaller. This is a change in amount of surface area taken up on the retinal image, but also a way of visualizing the imaginary solutions the time element of waves traveling in space.

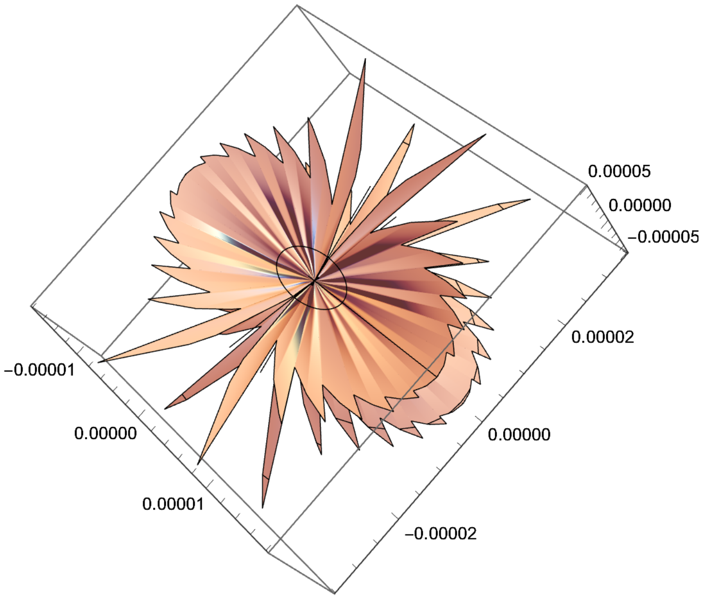
$$\texttt{RevolutionPlot3D}\left[r\,\frac{2}{3}\left(2\,\pi-\frac{2\,\pi}{\left(17+3\,\sqrt{33}\right)^{1/3}}+\left(17+3\,\sqrt{33}\right)^{1/3}\pi\right),\ \{r,\,-1,\,1\}\right]$$



$$\texttt{RevolutionPlot3D}\left[r\left(\frac{4\,\pi}{3}+\frac{2\left(1+\mathrm{i}\,\sqrt{3}\right)\pi}{3\left(17+3\,\sqrt{33}\right)^{1/3}}-\frac{1}{3}\left(1-\mathrm{i}\,\sqrt{3}\right)\left(17+3\,\sqrt{33}\right)^{1/3}\pi\right),\ \{r,\,-1,\,1\}\right]$$



$$\text{RevolutionPlot3D}\left[r\left(\frac{4\pi}{3}+\frac{2\left(1-\mathbb{i}\sqrt{3}\right)\pi}{3\left(17+3\sqrt{33}\right)^{1/3}}-\frac{1}{3}\left(1+\mathbb{i}\sqrt{3}\right)\left(17+3\sqrt{33}\right)^{1/3}\pi\right),\{r,-1,1\}\right]$$



When combined, the three imaginary solutions form a cone, but seperately, they exist primarily in the complex plane. It requires all three solutions to deliver information of depth to the perceiver through light in terms of the real. In Gibson' s theory, depth is intimately connected with contour. Contour is delivered by the pickup of the invariant, r, in the ambient array, changing context in a different way from point to point. Thus, understanding of two truths in the real world like information given to the perceiver of an object by an edge, for instance is enabled.

Mach begins by verifying a belief in the space - sense, an area of parameterized space relating the sense of an individual to the stimulus in the world. The space - sense provides a workspace for the individual senses like sense of sight and touch to enable a perceptual experience.“ The perception of Depth depends on extra - occular experiences” (BRP 118) is an idea that makes a great deal of sense to me, because when we experience or perceive truth, we use multiple faculties to make sense of a phenomenon.

The Wavelength with Changing Value during a Transition

The initial radius changes contexts, but can it be said to actually change? The wavelength, r, could be said to be changing if we consider that $\Delta r = r - r_1$. Although it is invariant in the context of always being the slant of the cone, it changes when understood to be the base of a cone. The height of the cone starts at zero and goes toward the locus of perception, which is the subjective perceiver. In the ambient array, many different wavelengths are present. It is reasonable, then to think that a wavelength could change during the course of traveling a single wavelength. When the circle is infinitely far away, it has a perceived radius of 0. It is important to discuss the ecological context of the meaning of the array. The initial radius could be thought of being analogous to the monocular field of vision.

$$v = \lambda f = r\,(1/(1080/\pi)\,\theta) = (1/(1080/\pi))\,D\left[\frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}, r, \theta\right] \tag{219}$$

$$(1/(1080/\pi))\,D\left[\frac{\sqrt{4\pi r^2\theta - r^2\theta^2}}{2\pi}, r, \theta\right]$$

$$\frac{\pi\left(-\frac{(4\pi r^2-2r^2\theta)(8\pi r\theta-2r\theta^2)}{8\pi(4\pi r^2\theta-r^2\theta^2)^{3/2}}+\frac{8\pi r-4r\theta}{4\pi\sqrt{4\pi r^2\theta-r^2\theta^2}}\right)}{1080} = \text{velocity during a transition} \tag{219}$$

$$(1080/\pi)\,\theta = \text{time} \tag{220}$$

$$\frac{2\pi v t}{\sqrt{4\pi\theta-\theta^2}} = \frac{2\pi v\,(1080/\pi)\,\theta}{\sqrt{4\pi\theta-\theta^2}} = \frac{2\pi\,\frac{\pi\left(-\frac{(4\pi r^2-2r^2\theta)(8\pi r\theta-2r\theta^2)}{8\pi(4\pi r^2\theta-r^2\theta^2)^{3/2}}+\frac{8\pi r-4r\theta}{4\pi\sqrt{4\pi r^2\theta-r^2\theta^2}}\right)}{1080}\,(1080/\pi)\,\theta}{\sqrt{4\pi\theta-\theta^2}} \tag{221}$$

$$\text{Solve}\left[r == \frac{2*\left(\frac{\pi\left(-\frac{(4\pi r^2-2r^2\theta)(8\pi r\theta-2r\theta^2)}{8\pi(4\pi r^2\theta-r^2\theta^2)^{3/2}}+\frac{8\pi r-4r\theta}{4\pi\sqrt{4\pi r^2\theta-r^2\theta^2}}\right)}{1080}\right)*6\,((180/\pi)\,\theta)*\pi}{\sqrt{4\pi\theta-(\theta)^2}}, r\right]$$

$$\left\{\left\{r \to -\sqrt{1+\frac{4\pi^2}{(4\pi-\theta)^2}-\frac{4\pi}{4\pi-\theta}}\right\}, \left\{r \to \sqrt{1+\frac{4\pi^2}{(4\pi-\theta)^2}-\frac{4\pi}{4\pi-\theta}}\right\}\right\}$$

This shows us that the parametric structure of our system still holds when the consideration that the wavelength of light, r, changes during transition. This leads to some evidence for Gibson's idea of an invariant in the structure of light.

In this wheel, when viewing it from head on, we see the entire rainbow of colors in terms of contour of a surface.

We recently found out that these are all valid statements for r, even when it is considered to be changing during a transition.

$$r = \pm\frac{2\,\pi * r * \mathrm{Sin}[\beta]}{\sqrt{4\,\pi\,\theta-\theta^2}} = \pm\frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta-\theta^2}} = \pm\frac{\sqrt{\frac{1}{4\,\pi-\theta}+\frac{4\,\pi}{\theta^2}-\frac{3}{\theta}}}{4\,\pi\,\sqrt{\theta}}$$

We can find out what η, the height of the cone is in terms of theta alone from this relation when r is changing.

$$\mathrm{Solve}\left[\frac{2\,\pi\,\eta}{\sqrt{4\,\pi\,\theta-\theta^2}} == \frac{\sqrt{\frac{1}{4\,\pi-\theta}+\frac{4\,\pi}{\theta^2}-\frac{3}{\theta}}}{4\,\pi\,\sqrt{\theta}}, \eta\right]$$

$$\left\{\left\{\eta \to \frac{\sqrt{\frac{1}{4\,\pi-\theta}+\frac{4\,\pi}{\theta^2}-\frac{3}{\theta}}\,\sqrt{4\,\pi\,\theta-\theta^2}}{8\,\pi^2\,\sqrt{\theta}}\right\}\right\}$$

When r = η, the circle will have gone around 2 π degrees. If the relations for a changing r hold, then we should arive at that answer.

$$\text{Solve}\left[\frac{\sqrt{\frac{1}{4\pi-\theta}+\frac{4\pi}{\theta^2}-\frac{3}{\theta}}}{4\pi\sqrt{\theta}} == \frac{\sqrt{\frac{1}{4\pi-\theta}+\frac{4\pi}{\theta^2}-\frac{3}{\theta}}\ \sqrt{4\pi\theta-\theta^2}}{8\pi^2\sqrt{\theta}},\ \theta\right]$$

$\{\{\theta \to 2\pi\}\}$

```

II. Spectral Sensitivity

The analogy of a change in position relating to a change in contour

$$\eta \to \frac{\sqrt{4 \pi r^2 \theta - r^2 \theta^2}}{2 \pi} = r \operatorname{Sin}[\beta]$$

$$r = \frac{2 \pi \eta}{\sqrt{4 \pi \theta - \theta^2}} = \frac{\sqrt{\frac{1}{4 \pi - \theta} + \frac{4 \pi}{\theta^2} - \frac{3}{\theta}} \sqrt{4 \pi \theta - \theta^2} \operatorname{Csc}[\beta]}{8 \pi^2 \sqrt{\theta}} = \sqrt{1 + \frac{4 \pi^2}{(4 \pi - \theta)^2} - \frac{4 \pi}{4 \pi - \theta}}$$

Boynton proposes that there is a, "scotopic spectral sensitivity curve, appropriate to the threshhold of the dark adapted eye outside the voeal region" (Psychophysic of Vision, 15). Boynton submits that the stimulus, "must be imaged in a part of the retina containing ahigh density of rod photoreceptors" (Psychophysics of Vision, 15).

Using induction, we can develop a series of true statements for r, so long as n is an integer. n would be a certain number of r, and r would always be a base unit of measure. Thus, we can say that:

```
c := speed of light := (2.99792458 * 10^8) m / s

c := (2.99792458 * 10^8)
```

First, we will use the following conversion

$$\eta := \text{rate} * \text{time} = c * \tau = \text{height of cone} \tag{222}$$

$\tau := 6\ (\theta_{\text{degrees}}) = 6\ ((180/\pi)\ \theta)$, because if theta were in radians to begin with, we would have to convert that number of radians to degrees. This way, both our thetas are in radians, but our result accounts for the constant of the degrees involved in measuring time.

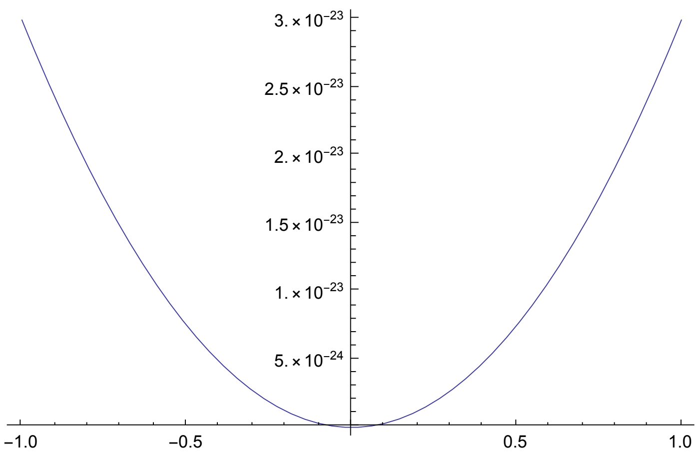
(180 / π)

$$r = \frac{2 * c * \tau * \pi}{\sqrt{4\,\pi\,\theta - \theta)^2}} = \frac{2 * c * 6\ ((180/\pi)\ \theta) * \pi}{\sqrt{4\,\pi\,\theta - (\theta)^2}}$$

$$\mathbf{Solve}\left[r == \frac{2 * c * 6\ ((180/\pi)\ \theta) * \pi}{\sqrt{4\,\pi\,\theta - (\theta)^2}}, \theta\right]$$

$$\left\{\left\{\theta \to \frac{4\,\pi\,r^2}{4\,665\,600\,c^2 + r^2}\right\}\right\}$$

$$\mathbf{Plot}\left[\frac{4\,\pi\,r^2}{4\,665\,600\,c^2 + r^2}, \{r, -1, 1\}\right]$$

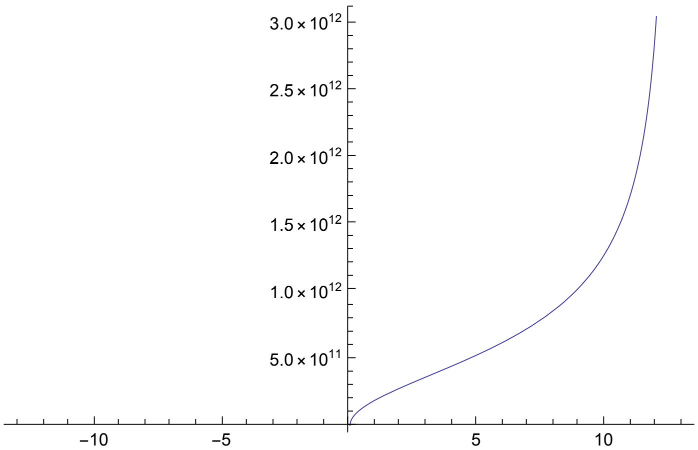


We zoom in

$$\mathbf{Solve}\left[\theta == \frac{4\,\pi\,r^2}{4\,665\,600\,c^2 + r^2}, r\right]$$

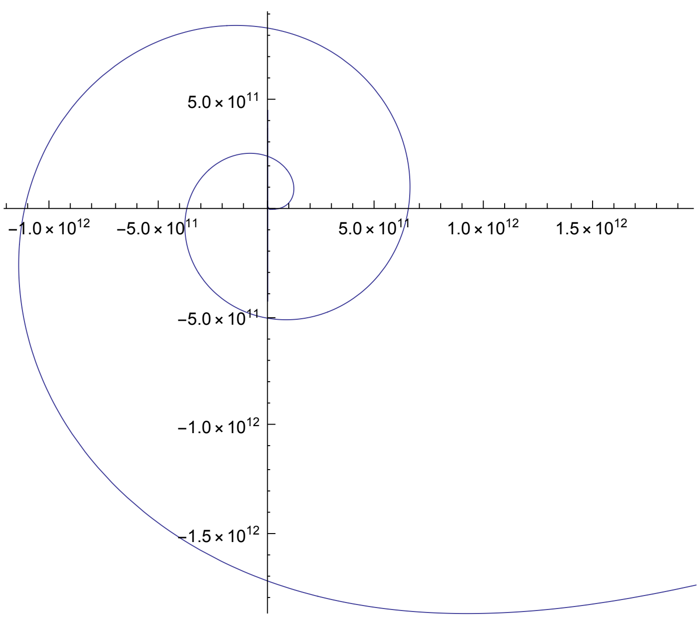
$$\left\{\left\{r \to -\frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\,\pi - \theta}}\right\}, \left\{r \to \frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\,\pi - \theta}}\right\}\right\}$$

$$\text{Plot}\left[\frac{2160\ c\ \sqrt{\theta}}{\sqrt{4\ \pi - \theta}},\ \{\theta,\ -13,\ 13\}\right]$$



If the quantum of light can be parameterized by its traveling up the height of the cone through time, we can say that the radius of the distance a wavelength of light travels expands to infinity over the course of two rotations, or 4π radians. The measurement

$$\text{PolarPlot}\left[\frac{2160\ c\ \sqrt{\theta}}{\sqrt{4\ \pi - \theta}},\ \{\theta,\ -13,\ 13\}\right]$$



This is what the motion would look like in polar coordinates.

$$r := \frac{2\ \pi\ \eta}{\sqrt{4\ \pi\ \theta - \theta^2}};\ \eta = r\ \text{Sin}[\theta]$$

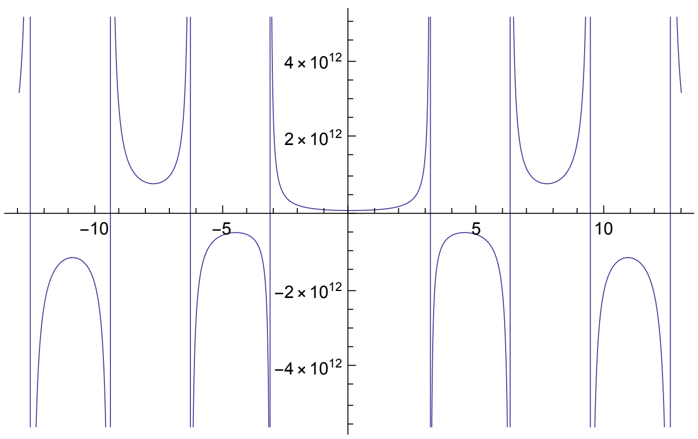
$$\frac{2160\ c\ \sqrt{\theta}}{\sqrt{4\ \pi - \theta}} = \frac{2\ \pi\ \eta}{\sqrt{4\ \pi\ \theta - \theta^2}} = \frac{2\ \pi\ r\ \text{Sin}[\theta]}{\sqrt{4\ \pi\ \theta - \theta^2}}$$

$$\text{Solve}\left[\frac{2160\, c\, \sqrt{\theta}}{\sqrt{4\,\pi - \theta}} == \frac{2\,\pi\, r\, \text{Sin}[\theta]}{\sqrt{4\,\pi\,\theta - \theta^2}},\ r\right]$$

$$\left\{\left\{r \to \frac{1080\, c\, \sqrt{\theta}\ \sqrt{(4\,\pi - \theta)\ \theta}\ \text{Csc}[\theta]}{\pi\ \sqrt{4\,\pi - \theta}}\right\}\right\}$$

It looks as though by setting up different true statements about what r is, we can get several different perspectives of what it does in terms of time. This suggests that there are multiple valid ways of perceiving a given change in perceptual space. These equations are meant to accurately represent the subjective experience of making a discernment in measuring some change in contour or size out in the world. In this sense, the meaning of that change in contour is already in the world, just like information.

$$\text{Plot}\left[\frac{1080\, c\, \sqrt{\theta}\ \sqrt{(4\,\pi - \theta)\ \theta}\ \text{Csc}[\theta]}{\pi\ \sqrt{4\,\pi - \theta}},\ \{\theta, -13, 13\}\right]$$



$$\text{PolarPlot}\left[\frac{1080\, c\, \sqrt{\theta}\ \sqrt{(4\,\pi - \theta)\ \theta}\ \text{Csc}[\theta]}{\pi\ \sqrt{4\,\pi - \theta}},\ \{\theta, -4\,\pi, 4\,\pi\}\right]$$

$$r = \frac{2 * c * \tau * \pi}{\sqrt{4\,\pi\ (\theta) - (\theta)^2}} = \frac{1080\, c\, \sqrt{\theta}\ \sqrt{(4\,\pi - \theta)\ \theta}\ \text{Csc}[\theta]}{\pi\ \sqrt{4\,\pi - \theta}} = \text{wavelength of light} = \lambda \quad (223)$$

$$\text{velocity} = \lambda\nu,\ \ \text{where}\ \nu = \text{number of mols of frequency} = n * f \quad (224)$$

$$f = 1 / (6 * (180 / \pi)\ \theta) = 1 / \tau \quad (225)$$

$$\text{Velocity} = \text{speed of light}$$

$$\text{Solve}\left[\frac{1080\, c\, \sqrt{\theta}\ \sqrt{(4\,\pi - \theta)\ \theta}\ \text{Csc}[\theta]}{\pi\ \sqrt{4\,\pi - \theta}}\ n\ (1 / (6\ (\theta))) == c,\ n\right]$$

$$\left\{\left\{n \to \frac{\pi\ \sqrt{4\,\pi - \theta}\ \sqrt{\theta}\ \text{Sin}[\theta]}{180\ \sqrt{(4\,\pi - \theta)\ \theta}}\right\}\right\} \quad (226)$$

r^2 = 1 + 3 + 5 ... (2 n - 1), where n is the position in the series.

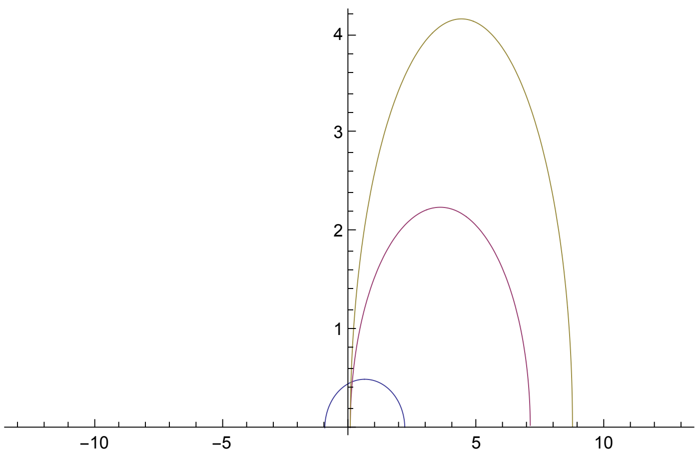
We will now plot this equation to resemble something similar to Figure 2 on Page 16 of Contemporary Theory and Research of Visual Perception edited by Haber.

$$\eta == \frac{\sqrt{4\,\pi\left(\frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\,\pi-\theta}}\right)^2\theta-\left(\frac{2160\,c\,\sqrt{\theta}}{\sqrt{4\,\pi-\theta}}\right)^2\theta^2}}{2\,\pi} =$$

$$\frac{\sqrt{4\,\pi\left(\frac{1080\,c\,\sqrt{\theta}\,\sqrt{(4\,\pi-\theta)\,\theta}\,\mathrm{Csc}[\theta]}{\pi\,\sqrt{4\,\pi-\theta}}\right)^2\theta-\left(\frac{1080\,c\,\sqrt{\theta}\,\sqrt{(4\,\pi-\theta)\,\theta}\,\mathrm{Csc}[\theta]}{\pi\,\sqrt{4\,\pi-\theta}}\right)^2\theta^2}}{2\,\pi} =$$

$$\frac{\sqrt{4\,\pi\left(\frac{2\,\pi\,r\,\mathrm{Sin}[\theta]}{\sqrt{4\,\pi\,\theta-\theta^2}}\right)^2\theta-\left(\frac{2\,\pi\,r\,\mathrm{Sin}[\theta]}{\sqrt{4\,\pi\,\theta-\theta^2}}\right)^2\theta^2}}{2\,\pi}$$

$$\mathrm{Plot}\left[\left\{\frac{\sqrt{4\,\pi\,1^2\,(\theta+1)-2^2\,(\theta+1)^2}}{2\,\pi},\ \frac{\sqrt{4\,\pi\,3^2\,\theta-4^2\,\theta^2}}{2\,\pi},\ \frac{\sqrt{4\,\pi\,5^2\,\theta-6^2\,\theta^2}}{2\,\pi}\right\},\ \{\theta,\ -13,\ 13\}\right]$$



In Boynton' s experiment, a method of sensory scaling was applied to the visual system, and yielded results that tell us the relative sensitivity (Radiance Basis) - Percent.

$$\sqrt{\sqrt{1+\frac{4\,\pi^2}{(4\,\pi-\theta)^2}-\frac{4\,\pi}{4\,\pi-\theta}}^{\,2}-\left(\frac{r\,\sqrt{4\,\pi\,\theta-\theta^2}}{8\,\pi^2\,\sqrt{\theta}}\right)^2},$$

The Mathematics of the 8 Fold Path

∞πcghmtθ

by Parker Emmerson

$$m \to \frac{2.2086893333333334`*^{\wedge}-42}{r} =$$

$$-\frac{(0.`+5.468107888071038`*^{\wedge}-56\,i)\ \sqrt{-1.60287714`*^{\wedge}8+1.2755291`*^{\wedge}7\,\theta}}{\sqrt{\theta}}$$

This function of mass comes from the parameters of light traveling from a circle into a cone, thus the change in radius can be integrated. When a circle folds into a cone, it doesn't have to go all the way around the cone in order to reach the height. For the above equation, we used the S.I. substitution of 6 θ = time, where theta is the distance in angle through which the initial radius of the circle translates into a height for a cone. The parameters of the cone do not include that it is necessary to go all the way around the circle. We will see into the wave nature of light more closely and make the observation of the diagonal wave shape of the assymptotic functions of wisdom (i.e. the first two roots).

$$\text{Solve}\left[m == \frac{2.2086893333333334\grave{}*\hat{}-42}{r}, r\right]$$

$$\left\{\left\{r \to \frac{2.20869 \times 10^{-42}}{m}\right\}\right\}$$

This is the equation for radius in terms of the mass of light.

$$\left\{\left\{\nu \to \frac{0.02652582384864922\grave{}\ \sqrt{12.566370614359172\grave{}\ \theta - 1.\grave{}\ \theta^2}}{\theta}\right\}\right\}$$

This frequency comes from :

$$r = \frac{2\ (3.0 * 10\hat{}8)\ (6)\ (\theta)\ \pi}{\sqrt{4\ \pi\ \theta - \theta^2}} = \lambda$$

$$c = \lambda f$$

(See the Geometric Patterns of Perception Series for more in depth solutions (explainations, system of variables and postulates))

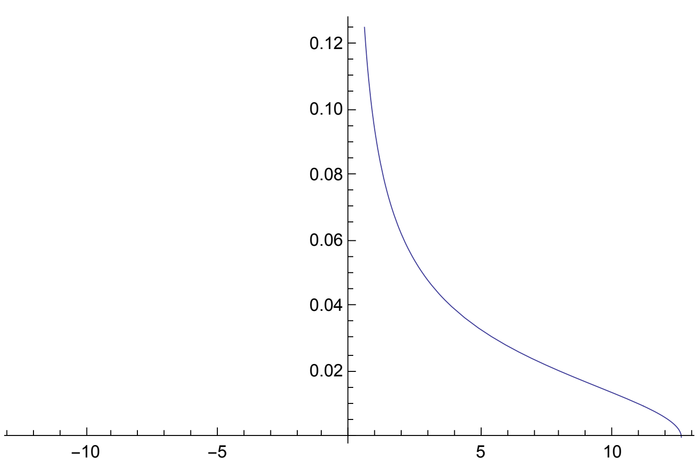
$$\text{Solve}\left[(3.0 * 10\hat{}8) == \frac{2\ (3.0 * 10\hat{}8)\ (6)\ (\theta)\ \pi}{\sqrt{4\ \pi\ \theta - \theta^2}} * \nu,\ \nu\right]$$

$$\left\{\left\{\nu \to \frac{0.0265258\ \sqrt{12.5664\ \theta - 1.\ \theta^2}}{\theta}\right\}\right\}$$

$$\text{Solve}\left[1 == \frac{(\theta)\ \pi}{\sqrt{4\ \pi\ \theta - \theta^2}} * \nu,\ \nu\right]$$

$$\left\{\left\{nf \to \frac{\sqrt{(4\ \pi - \theta)\ \theta}}{\pi\ \theta}\right\}\right\}$$

$$\text{Plot}\left[\frac{0.02652582384864922\grave{}\ \sqrt{12.566370614359172\grave{}\ \theta - 1.\grave{}\ \theta^2}}{\theta}, \{\theta, -4\ \pi, 4\ \pi\}\right]$$



ν is the frequency solved from the speed of light and a wavelength of r. r is able to be placed in terms of

purely theta. If *v* is 0, then there is an infinite amount of mass, unless Planck's constant were to be considered nothing (only when nothing in terms of theta reaches infinity in terms of mass).

```
Solve[-1/Sqrt[θ] (0.`+5.468107888071038`*^-56 I) Sqrt[-1.60287714`*^8+1.2755291`*^7 θ] ==
  2.2086893333333334`*^-42/r, θ]
```

$$\left\{\left\{\theta \to \frac{8.21431\times 10^{90}\, r^2}{8.36115\times 10^{109} + 6.53674\times 10^{89}\, r^2}\right\}\right\}$$

$$\left\{\left\{r \to \frac{(0.`+4.039220473596917`*^{\wedge}13\, i)\sqrt{\theta}}{\sqrt{-1.60287714`*^{\wedge}8 + 1.2755291`*^{\wedge}7\, \theta}}\right\}\right\}$$

The equation for the height of the cone from basic postulates of geometry :

$$\sqrt{\frac{r^2\,(4\pi-\theta)\,\theta}{4\pi^2}} = h$$

The gravitational constant for a certain mass :

g = ((m G) / r ^ 2) r̂

That into which we substitute our equations for the radius of a light wave and the mass of an object (a mass that can be described like the wave of energy of light or any light containing object), as well as the radius of the initial circle (i.e. the maximum (and our distance away from the ground) height) is the gravitational constant. The energy of the potential of another object of the same mass falling is then set equal to the energy of light (i.e. our perception or sense of the visual world).

```
G = 6.6742 * (10 ^ -11)

g = ((m (6.6742 * (10 ^ -11))) / r ^ 2) r̂
```

r̂ = the height, because it is the function resulting from the change in radius through theta (which can be integrated for r and not for θ so easily).

$$g = ((m\,(6.6742 * (10^{\wedge}-11)))\, /\, r^{\wedge}2)\sqrt{\frac{r^2\,(4\pi-\theta)\,\theta}{4\pi^2}}$$

$$g = \left(\left(\frac{2.2086893333333334`*^{\wedge}-42}{r}\,(6.6742 * (10^{\wedge}-11))\right)\Big/ r^{\wedge}2\right)$$
$$\sqrt{\left(\frac{1}{4\pi^2} r^2 \left(4\pi - \left(\frac{8.214307872349999`*^{\wedge}90\, r^2}{8.361147002216258`*^{\wedge}109 + 6.53673850981586`*^{\wedge}89\, r^2}\right)\right)\right.}$$
$$\left.\left(\frac{8.214307872349999`*^{\wedge}90\, r^2}{8.361147002216258`*^{\wedge}109 + 6.53673850981586`*^{\wedge}89\, r^2}\right)\right)$$

$$m \to \frac{2.2086893333333334`*^{\wedge}-42}{r}$$

E = mc^2 = mgh, where m is mass, c is speed of light, and h is the height (with a max value of the wave-length, r := λ.

$$E = \frac{2.2086893333333334`*^{-42}}{r}((3.0*10^{8})^{2})$$

$$\frac{2.2086893333333334`*^{-42}}{r}((3.0*10^{8})^{2}) = m*g*h = \frac{2.2086893333333334`*^{-42}}{r}\left(\left(\frac{2.2086893333333334`*^{-42}}{r}(6.6742*(10^{-11}))\right)\Big/ r^{2}\right)$$

$$\sqrt{\left(\frac{1}{4\pi^2} r^2 \left(4\pi - \left(\frac{8.214307872349999`*^{90} r^2}{8.361147002216258`*^{109} + 6.53673850981586`*^{89} r^2}\right)\right)\left(\frac{8.214307872349999`*^{90} r^2}{8.361147002216258`*^{109} + 6.53673850981586`*^{89} r^2}\right)\right)}$$

$$\left((3.0*10^{8})\ 6\ \frac{8.214307872349999`*^{90} r^2}{8.361147002216258`*^{109} + 6.53673850981586`*^{89} r^2}\right) =$$

$$((\text{Planck's Constant})\ \nu) =$$

$$(6.62606896*10^{-34})\ \frac{0.02652582384864922`\ \sqrt{12.566370614359172`\ \theta - 1.`\ \theta^2}}{\theta}$$

This starts the funk :

$$\text{Solve}\left[\sqrt{\left(\frac{1}{4\pi^2} r^2 \left(4\pi - \left(\frac{8.214307872349999`*^{90} r^2}{8.361147002216258`*^{109} + 6.53673850981586`*^{89} r^2}\right)\right)\left(\frac{8.214307872349999`*^{90} r^2}{8.361147002216258`*^{109} + 6.53673850981586`*^{89} r^2}\right)\right)}\left((3.0*10^{8})\ 6\ \frac{8.214307872349999`*^{90} r^2}{8.361147002216258`*^{109} + 6.53673850981586`*^{89} r^2}\right) == (6.62606896*10^{-34})\ \frac{0.02652582384864922`\ \sqrt{12.566370614359172`\ \theta - 1.`\ \theta^2}}{\theta}, r\right]$$

These eight roots symbolize the eightfold path. There is also buddhist art that uses the same shape or design motif for illustration.

```

The rest of the roots won' t plot, or their plots are 0. The eight roots are symbolic of the eightfold path, for when.

But, what if the frequency is 0? Could we find the plots of the other roots?

Thanks ! ©Parker Emmerson 2009

```
